

Fully 3D Long-Term Simulation of the Coupling Resonance Experiments at the CERN PS

Ji Qiang and Robert Ryne, LBNL
Giuliano Franchetti, Ingo Hofmann, GSI
Elias Metral, CERN

HB2012, Beijing, China

Outline

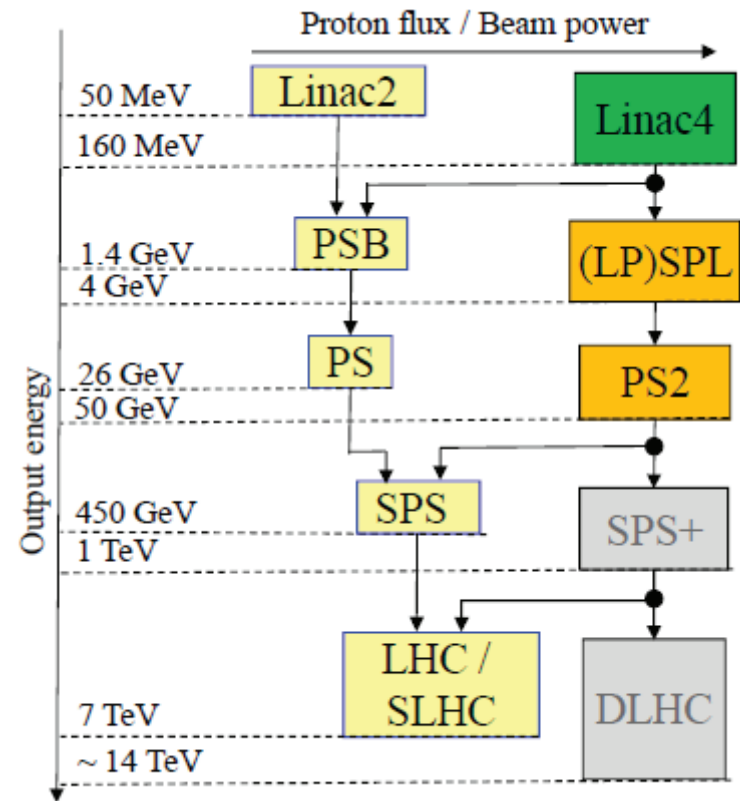

- Introduction
- Computational model
- Simulation of Montague resonance experiment at PS
- Summary

Introduction

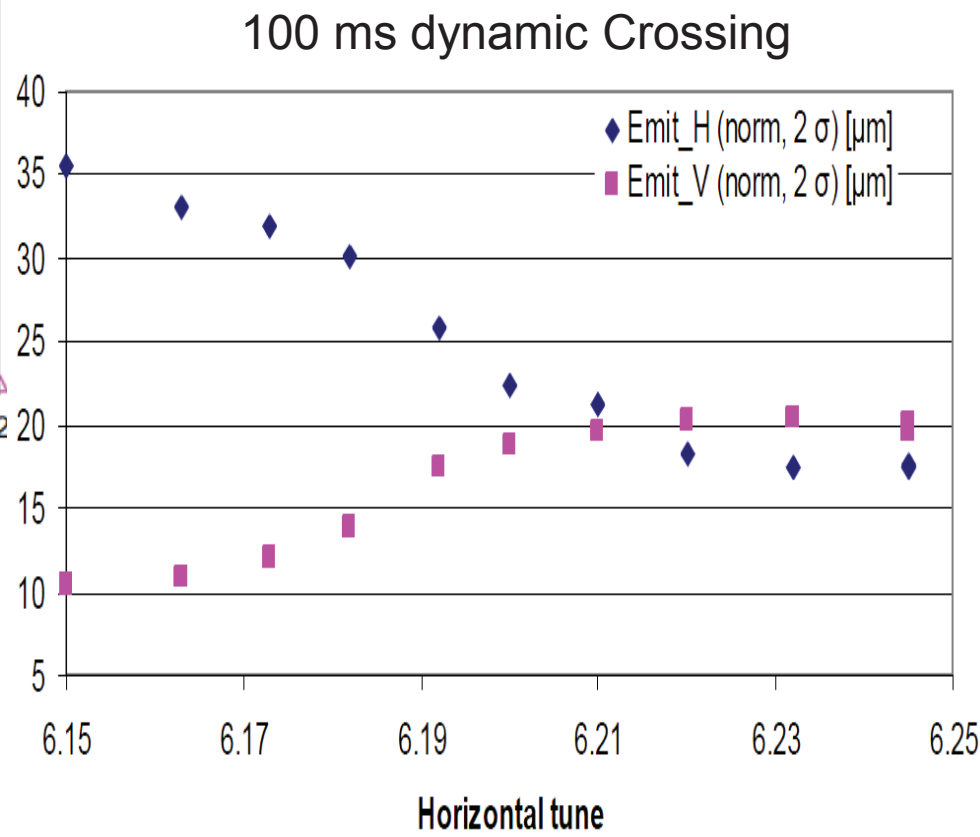

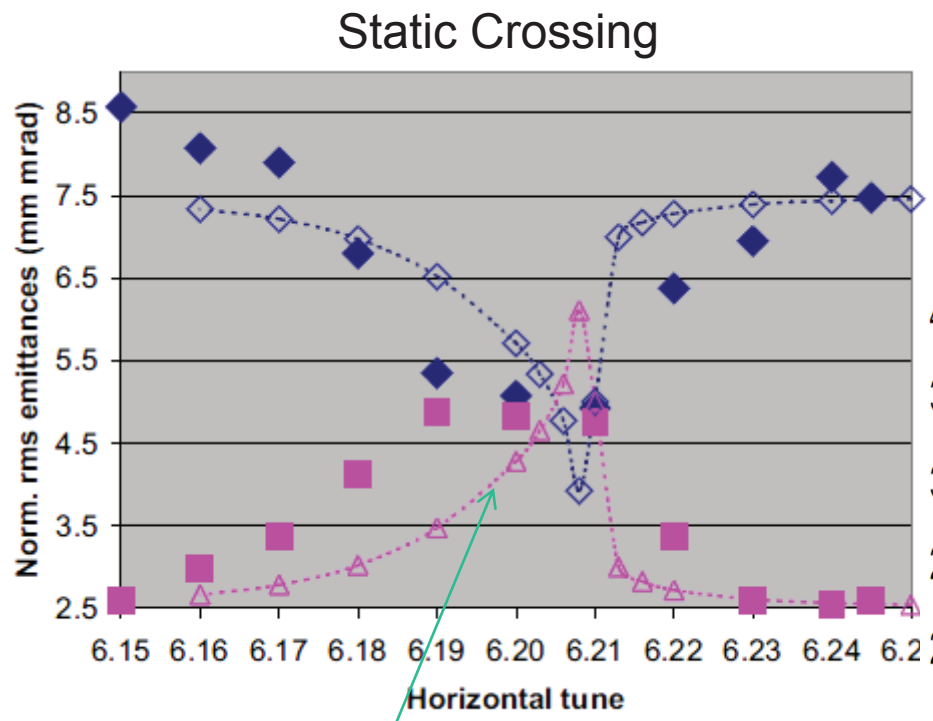

- Proton-Synchrotron (PS) is amongst the LHC injectors the oldest, and will continue to serve the LHC at least for the next 25 years.
- Space-charge effects is a dominant factor limiting the bunch intensity.
- Montague Resonance:
$$2 Q_x - 2 Q_y = 0$$
- can cause particle due to unequal aperture size in horizontal and vertical dimensions.
- benchmark space-charge codes

IMPACT Code Suite

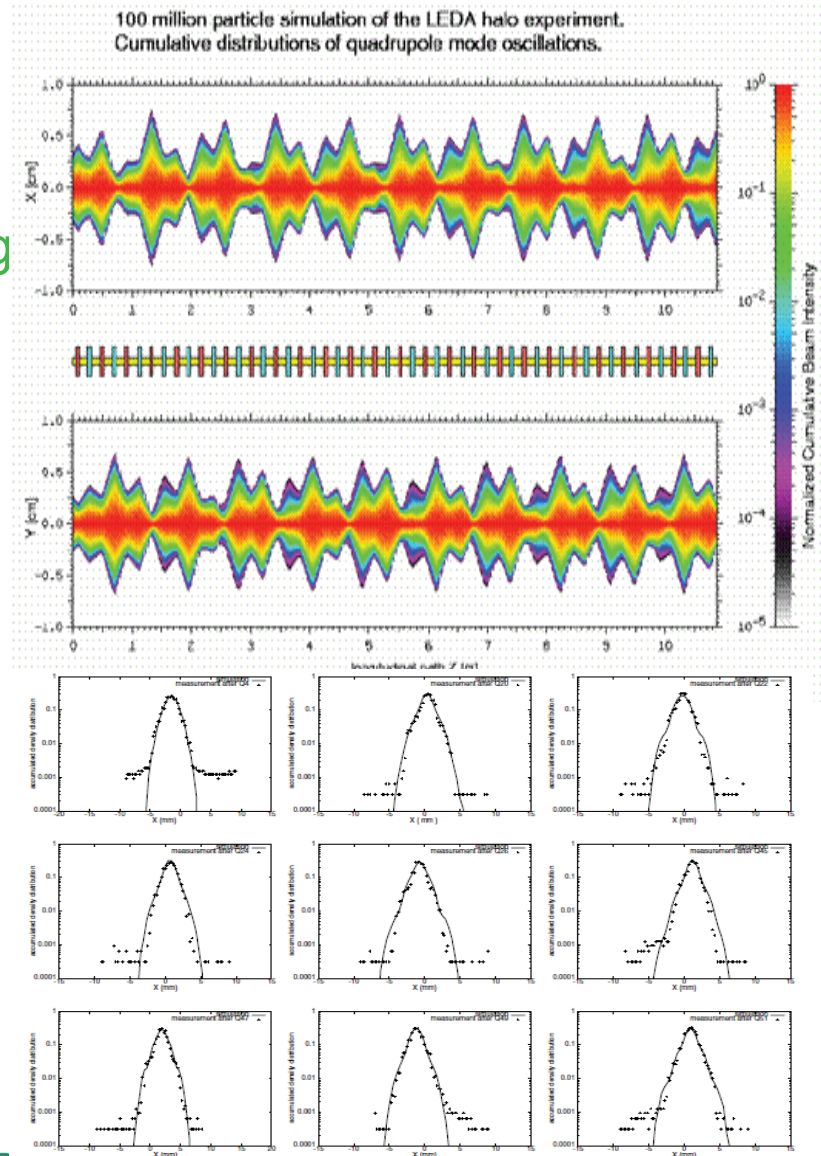

- IMPACT-Z: parallel PIC code (z-code)
- IMPACT-T: parallel PIC code (t-code)
- Envelope code, pre- and post-processors,...
- Optimized for parallel processing
- Applied to many projects: SNS, JPARC, RIA, FRIB, PS2, future light sources, advanced streak cameras,...
- Has been used to study photoinjectors for BNL e-cooling project, Cornell ERL, FNAL/A0, LBNL/APEX, ANL, JLAB, SLAC/LCLS

One Billion Macroparticle
Simulation of an FEL Linac
(~2 hrs on 512 processors)

- Parallel PIC code using coordinate “z” as the independent variable
- Key Features
 - Detailed RF accelerating and focusing model
 - Multiple 3D Poisson solvers
 - Variety of boundary conditions
 - 3D Integrated Green Function
 - Multi-charge state
 - Machine error studies and steering
 - Wakes
 - CSR (1D)
 - Run on both serial and multiple processor computers

Particle-in-cell simulation with split-operator method

- Particle-in-cell approach:
 - Charge deposition on a grid
 - Field solution via spectral-finite difference method with transverse rectangular conducting pipe and longitudinal open
 - Field interpolation from grid to particles
- Split-operator method with $\mathbf{H} = \mathbf{H}_{\text{external}} + \mathbf{H}_{\text{space charge}}$
- Thin lens kicks for nonlinear elements
- Lumped space-charge at a number locations

Poisson Solver Used in Space-Charge Calculation

$$\frac{\partial^2 \phi}{\partial x^2} + \frac{\partial^2 \phi}{\partial y^2} + \frac{\partial^2 \phi}{\partial z^2} = -\frac{\rho}{\epsilon_0}$$

with boundary conditions

$$\phi(x=0, y, z) = 0,$$

$$\phi(x=a, y, z) = 0,$$

$$\phi(x, y=0, z) = 0,$$

$$\phi(x, y=b, z) = 0,$$

$$\phi(x, y, z = \pm\infty) = 0,$$

$$\rho(x, y, z) = \sum_{l=1}^{N_l} \sum_{m=1}^{N_m} \rho^{lm}(z) \sin(\alpha_l x) \sin(\beta_m y),$$

$$\phi(x, y, z) = \sum_{l=1}^{N_l} \sum_{m=1}^{N_m} \phi^{lm}(z) \sin(\alpha_l x) \sin(\beta_m y),$$

where

$$\rho^{lm}(z) = \frac{4}{ab} \int_0^a \int_0^b \rho(x, y, z) \sin(\alpha_l x) \sin(\beta_m y),$$

$$\phi^{lm}(z) = \frac{4}{ab} \int_0^a \int_0^b \phi(x, y, z) \sin(\alpha_l x) \sin(\beta_m y),$$

$$\frac{\partial^2 \phi^{lm}(z)}{\partial z^2} - \gamma_{lm}^2 \phi^{lm}(z) = -\frac{\rho^{lm}(z)}{\epsilon_0},$$

$$\frac{\phi_{n+1}^{lm} - 2\phi_n^{lm} + \phi_{n-1}^{lm}}{h_z^2} - \gamma_{lm}^2 \phi_n^{lm} = -\frac{\rho_n^{lm}}{\epsilon_0},$$

$$\phi_{-1}^{lm} = \exp(-\gamma_{lm} h_z) \phi_0^{lm}, \quad n = 0,$$

$$\phi_{N+1}^{lm} = \exp(-\gamma_{lm} h_z) \phi_N^{lm}, \quad n = N.$$

Numerical Solutions vs. Analytical Solutions

Physical Parameters of PS

Physical parameters:

RF frequency = 3.5 MHz

RF voltage = 27 kV

$E_k = 1.4 \text{ GeV}$

Emit_x = 7.5 mm-mrad

Emit_y = 2.5 mm-mrad

Rms bunch length = 45 ns

Rms $dp/p = 1.7 \times 10^{-3}$

Horizontal tune: 6.15 – 6.245

Vertical tune: 6.21

Synchrotron period: 1.5 ms

Half Aperture = 7cm x 3.5cm

$I = 1.0 \times 10^{12}$

Refs: B. W. Montague, CERN-Report No. 68-38, CERN, 1968.

E. Metral et al., Proc. of EPAC 2004, p. 1894.

I. Hofmann et al., Proc. of EPAC 2004, p. 1960.

Generation of Initial Matched Distribution

- Zero current match found using MaryLie normal form capabilities:
 - Normalize 1-turn map: $M=ANA^{-1}$
 A is the normalizing map
 N is the normal form which causes only rotations in phase space
 - Consider a function $g((x^2+p_x^2),(y^2+p_y^2),(t^2+p_t^2))$
 - Then $f(\zeta)=g(A(x^2+p_x^2),(y^2+p_y^2),(t^2+p_t^2))$ is a matched beam.

Proof: The distribution after one turn is given by

$$\begin{aligned} f(M^{-1}\zeta) &= g(AN A^{-1}A(x^2+p_x^2),(y^2+p_y^2),(t^2+p_t^2)) = \\ &= g(AN(x^2+p_x^2),(y^2+p_y^2),(t^2+p_t^2)) = \\ &= g(A(x^2+p_x^2),(y^2+p_y^2),(t^2+p_t^2)) \end{aligned}$$

Numerical Parameters: Test of Convergence (1)

100k vs. 200k marco-particles

Numerical Parameters: Test of Convergence (2)

Numerical Parameters: Test of Convergence (3)

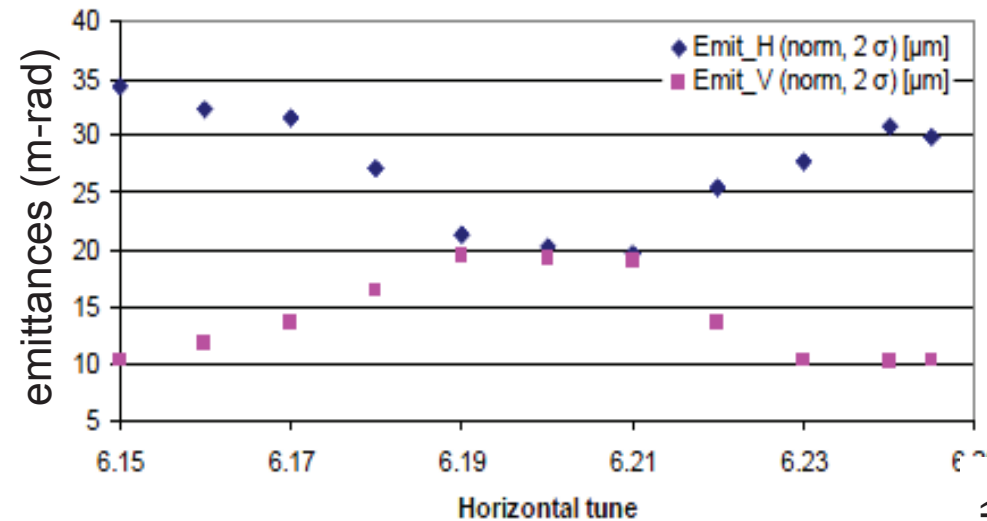

100k, 65x65x129 vs. 200k, 65x65x257

Summary

- 3D self-consistent space-charge simulation reproduce the experiment data reasonably well
- Dynamic Montague resonance crossing shows no symmetry around the resonance stopband
- Longitudinal synchrotron motion helps the emittance exchange inside the resonance stopband
