

RemoteVis:

An Efficient Library for remote
visualization
of large volumes using Nvidia Index

- T. Spina, A. Peixinho, M. Bernardi, F. Furusato, E. Miqueles, D. Alnajjar. (CNPEM, Brazil)
 - M. Nienhaus, A. Kuhn. (NVIDIA, Germany)

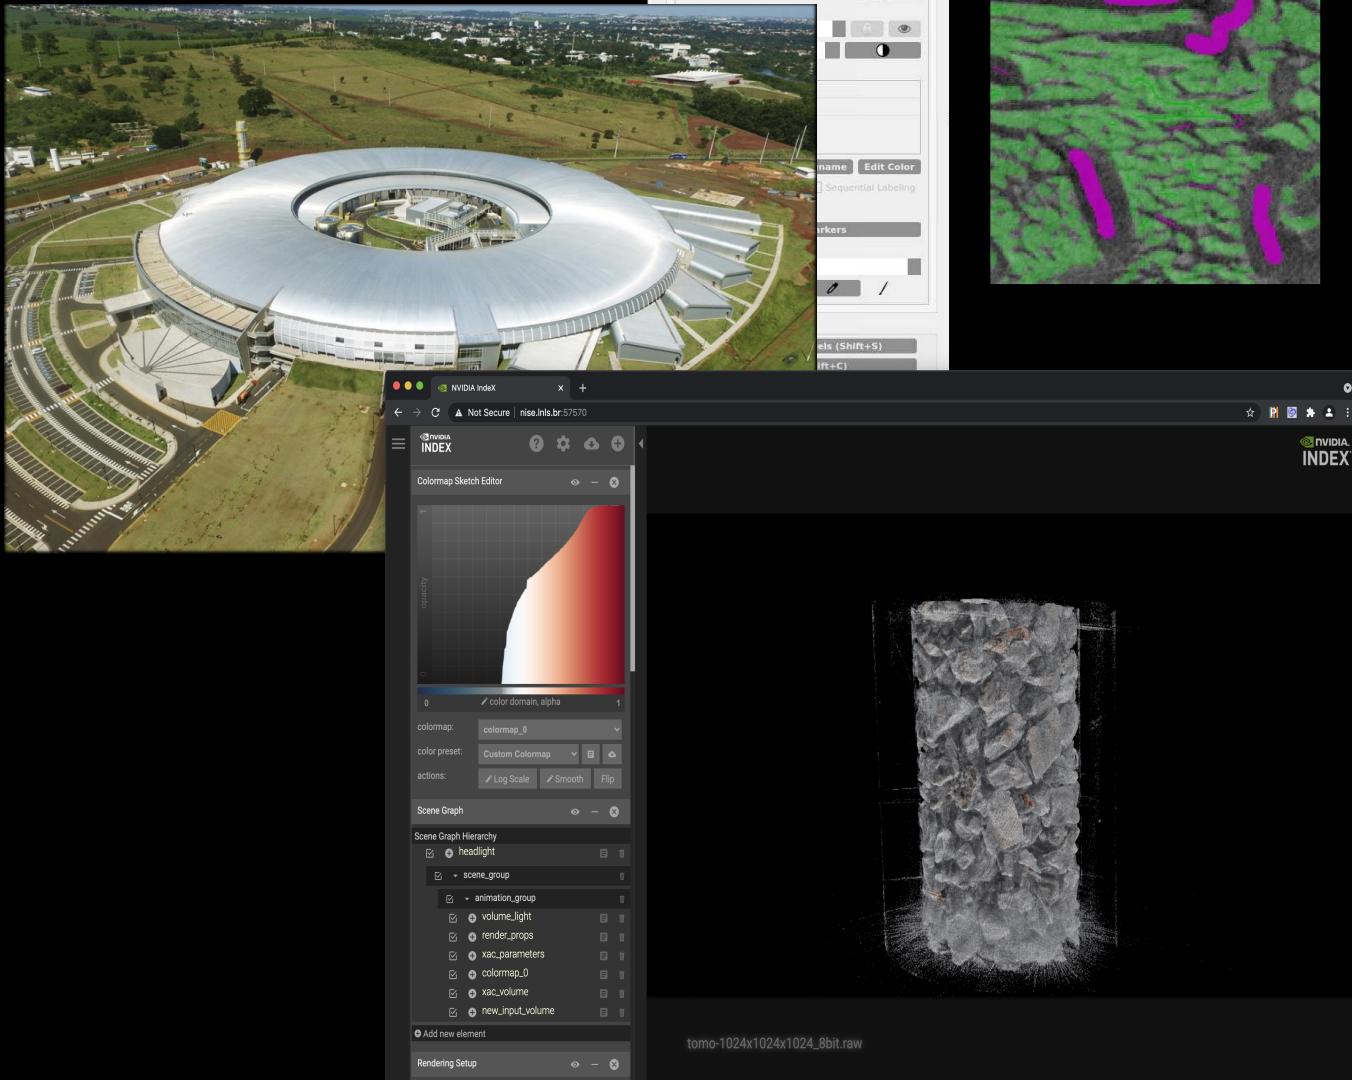

UVX (<2020)

Synchrotron Light Source
2nd Generation
Experiments: up to hours/days
18 beamlines

Image Size: $(2048^3 / 8bit) 8GB$

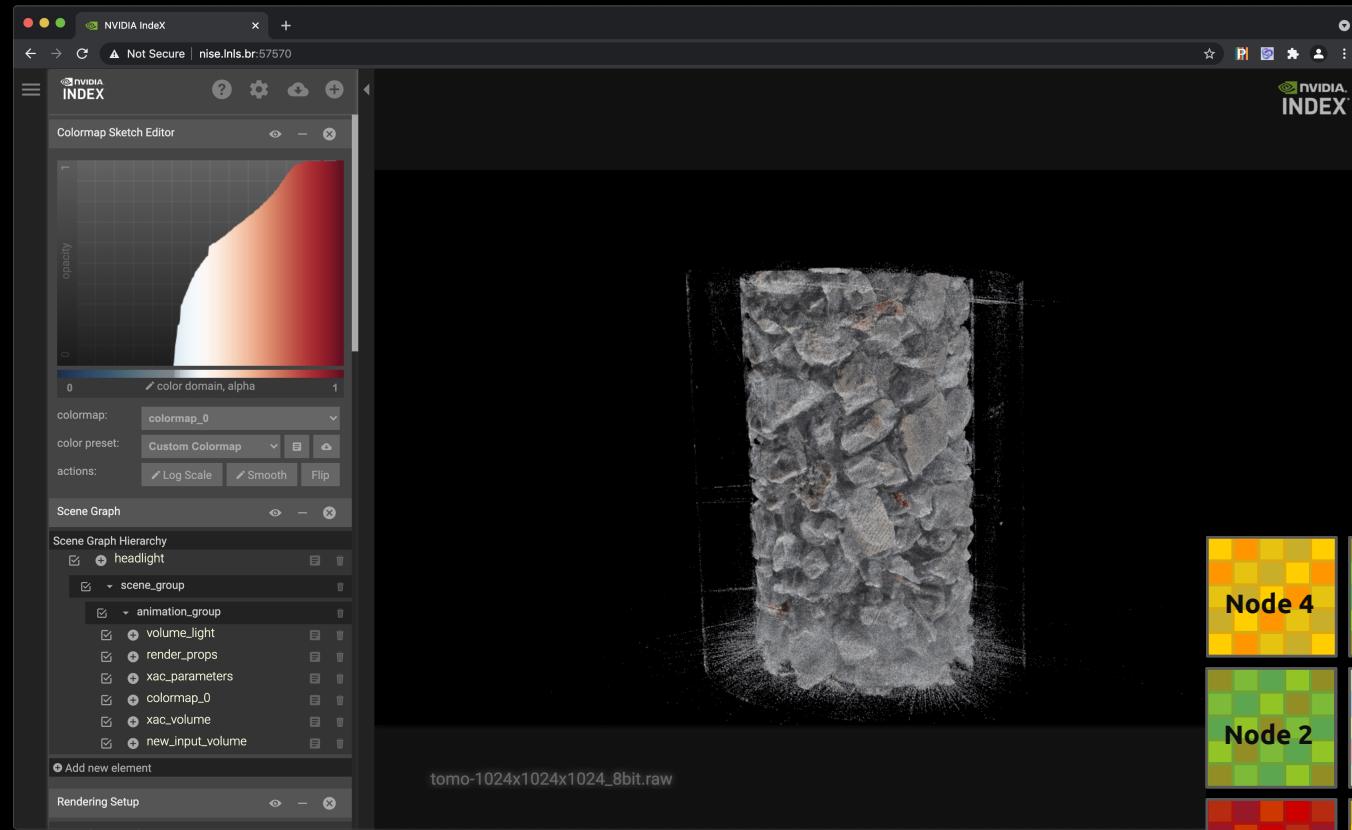

SIRIUS (2020)

4th Generation Light Source
Experiments: minutes/seconds
Tomography
CDI
Ptychography
13 beamlines under construction

Expected Image Size $2072^3 / 32\text{bit}$) 108GB

Visualizing Large Datasets with Index

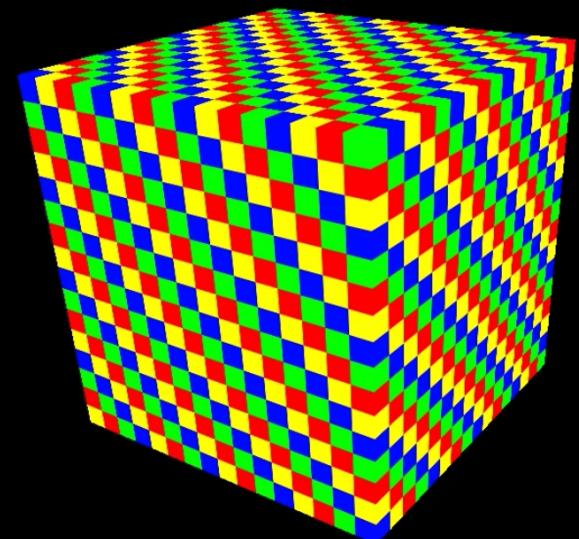

Fast rendering of large volumes

Multi GPU/Multi Node support

Customizable rendering shaders (XAC)

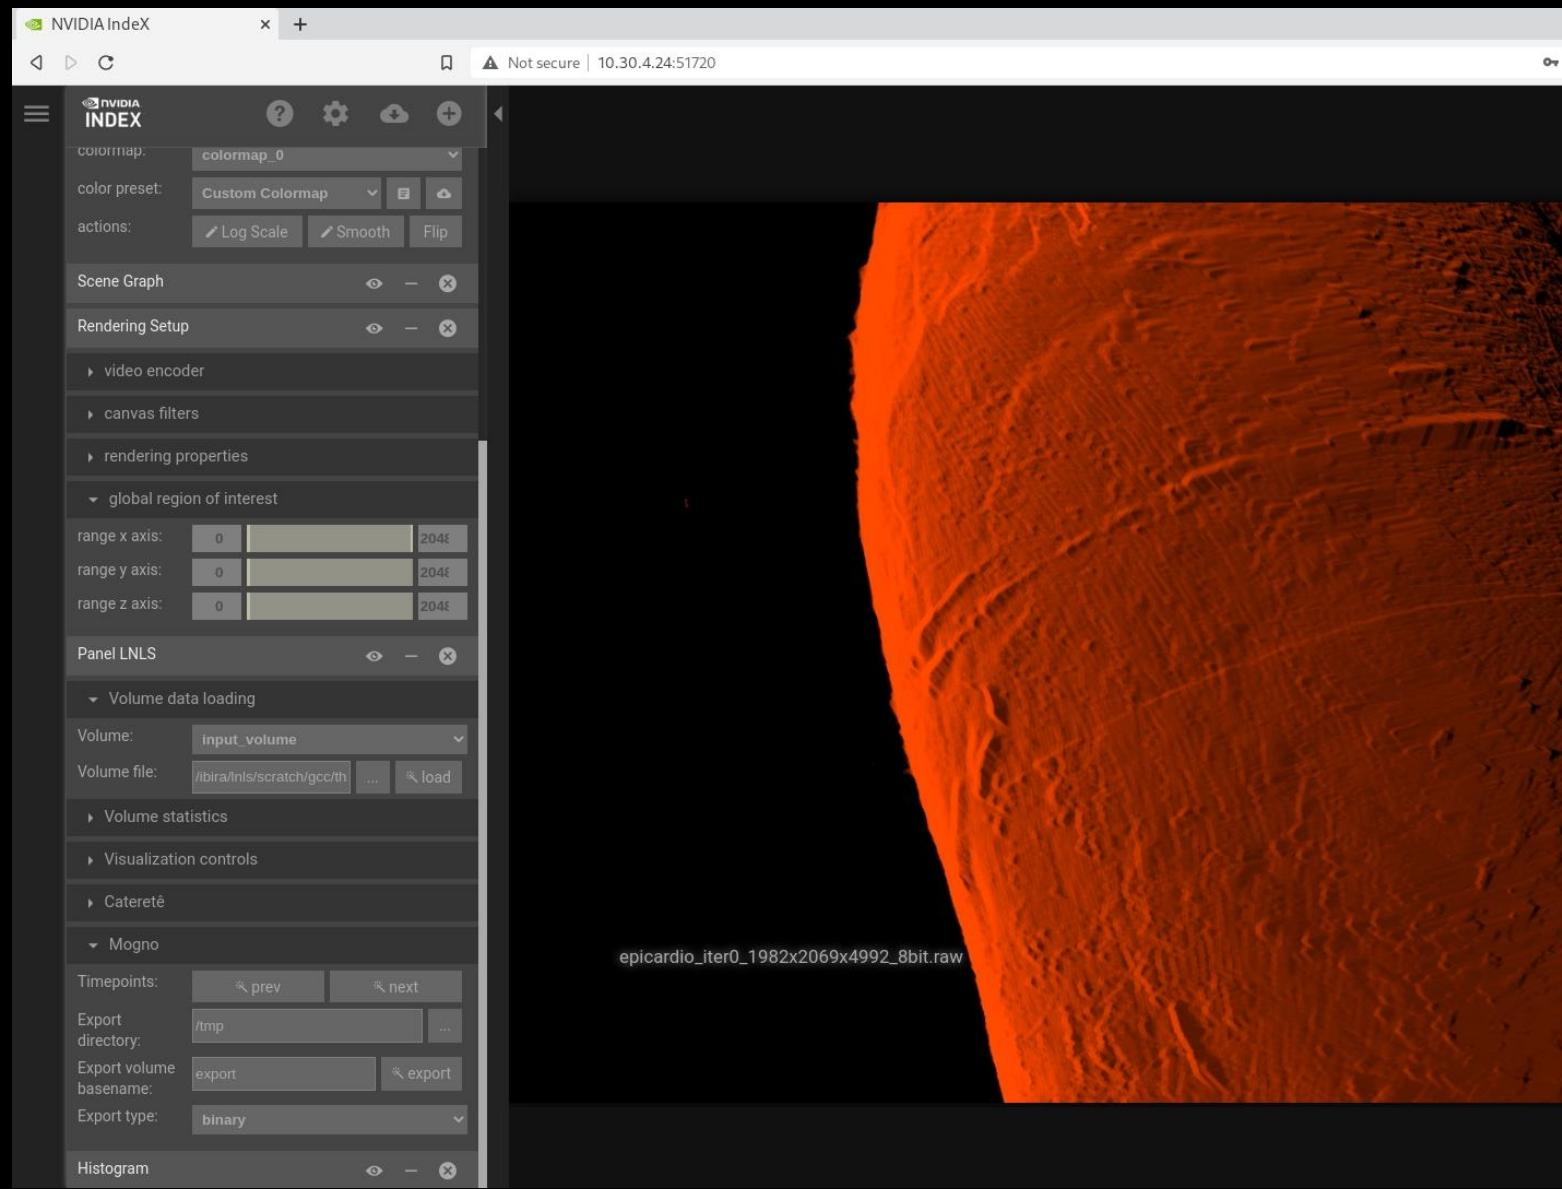

Web based viewer

Nvidia IndeX - LNLS Plugin

C++ Plugin extensions

Accommodating needs of
beamlines

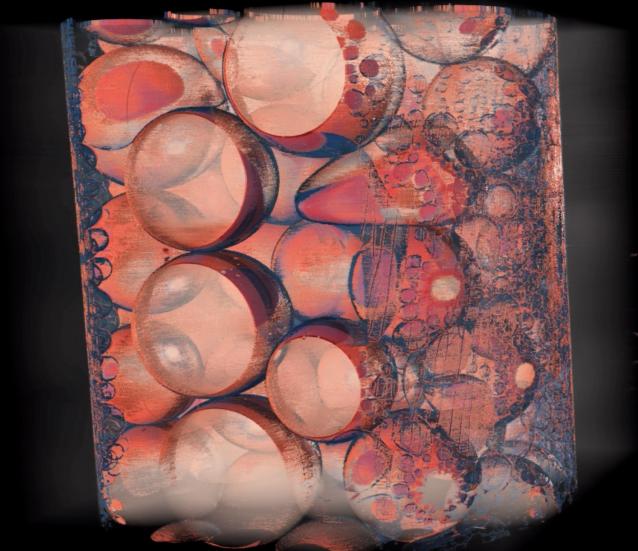

Visualizing Large Datasets with IndeX

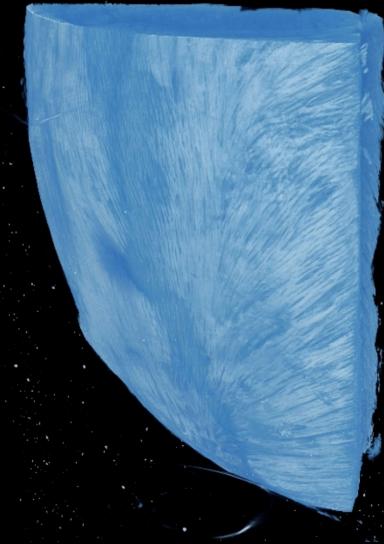

3D Reciprocal Space Mapping

Visualizing Large Datasets with IndeX

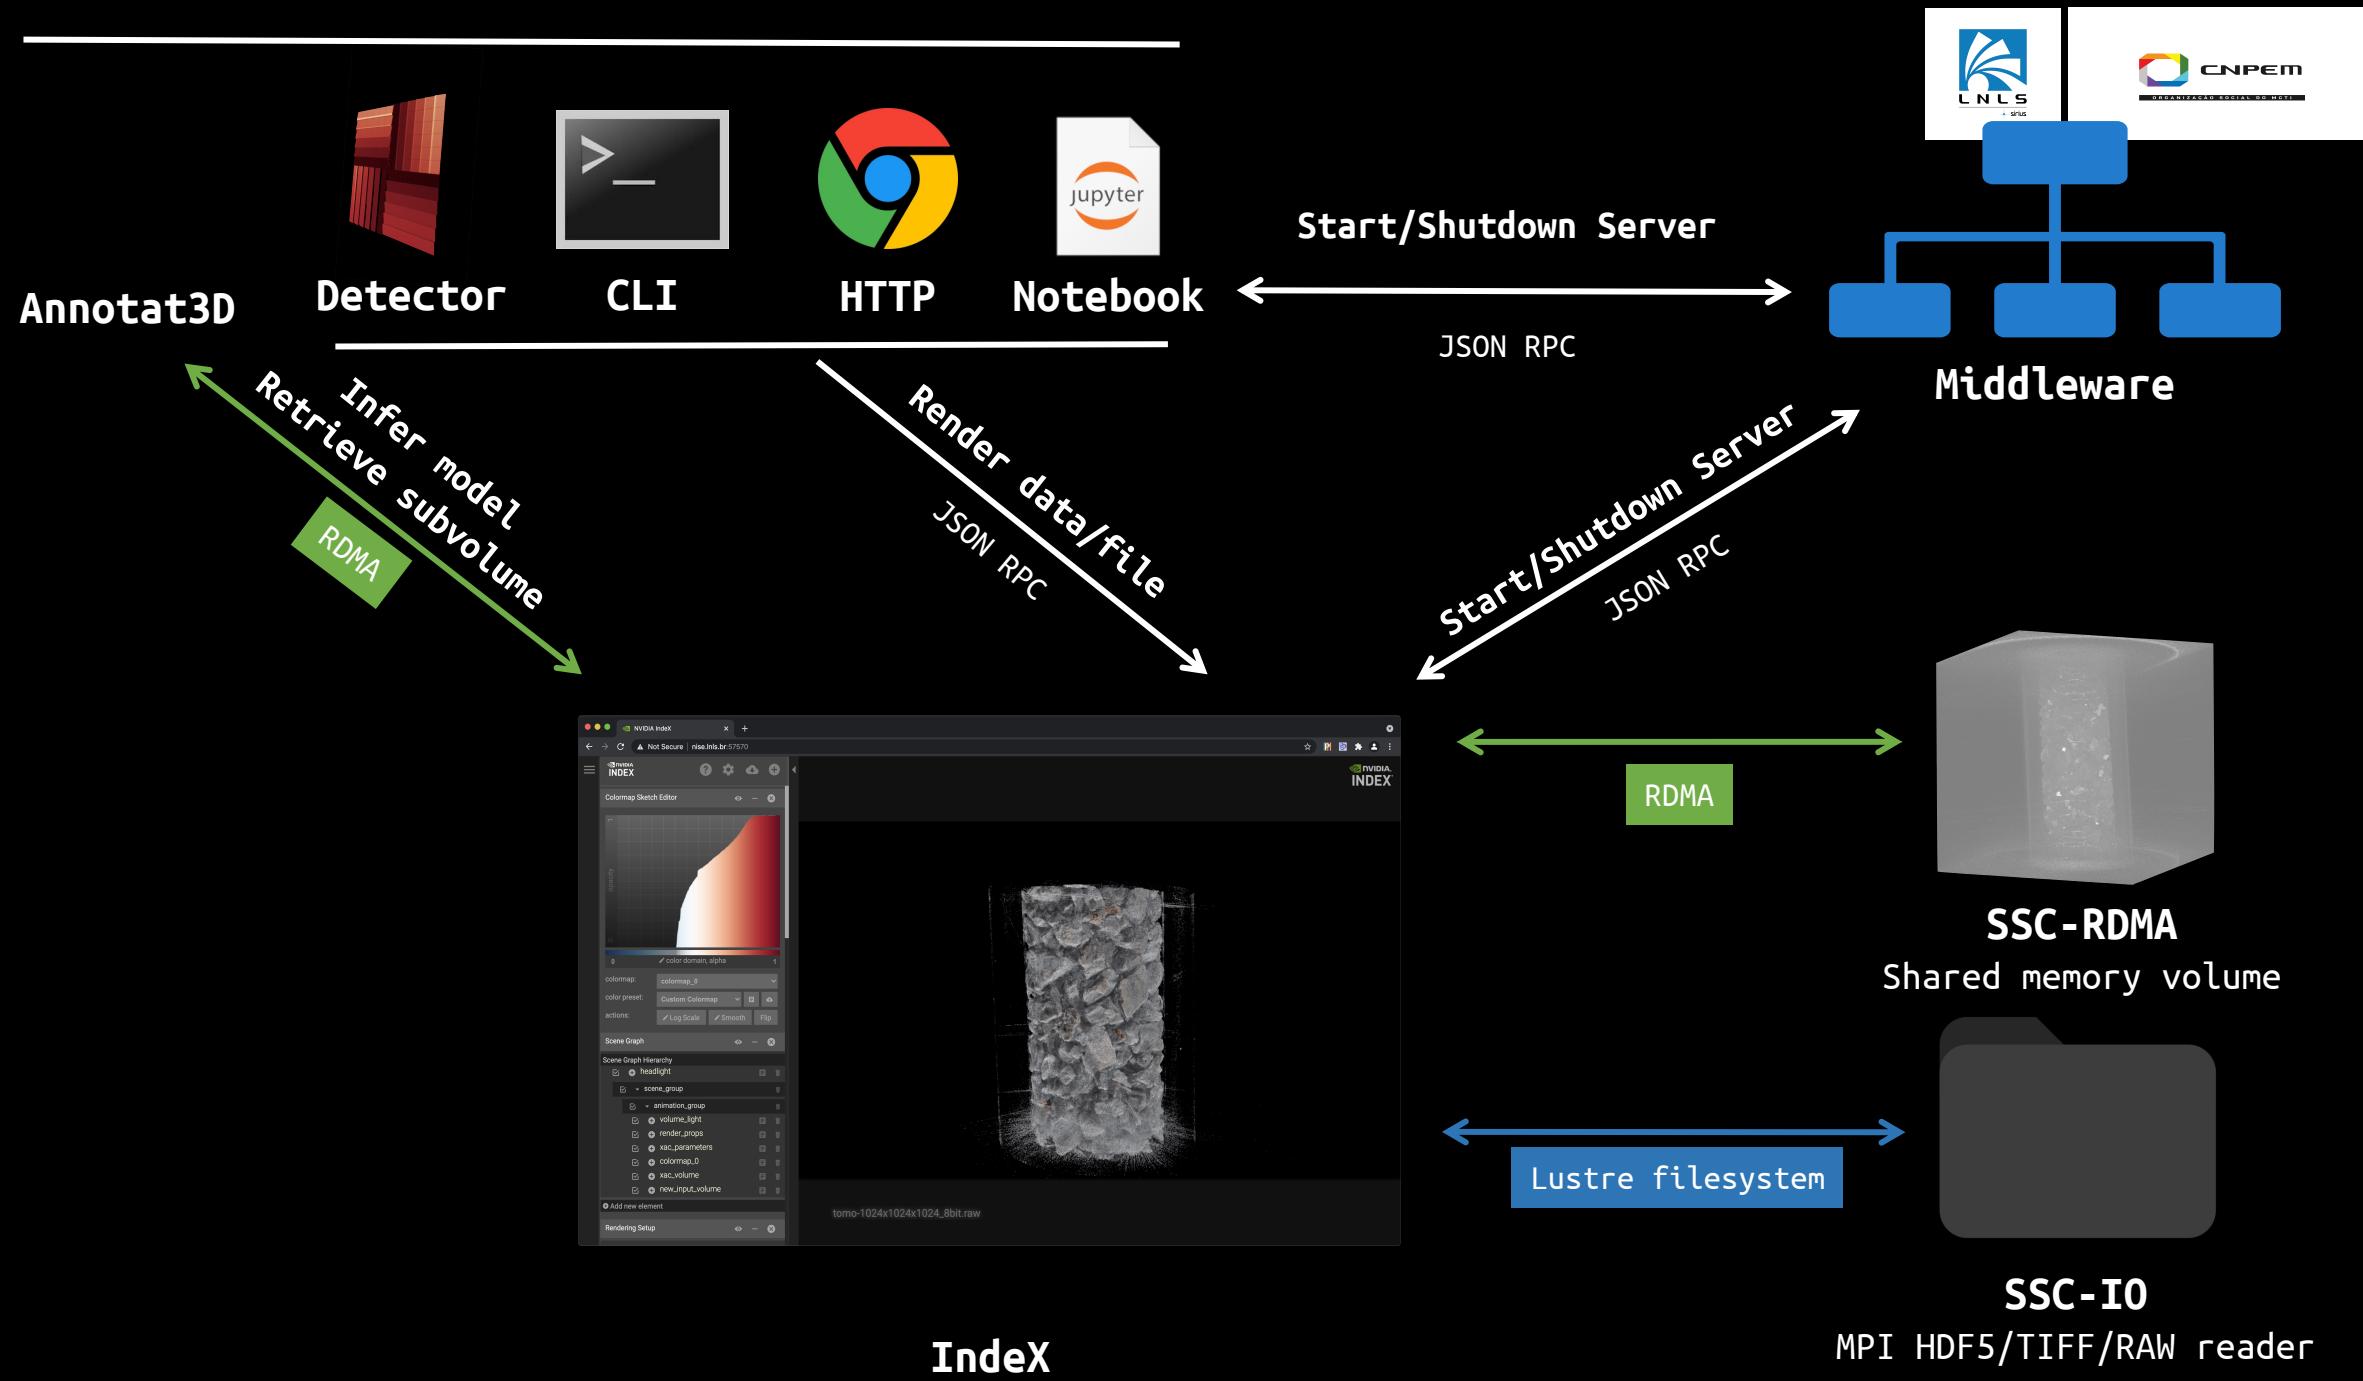

Silica bead pore space (fluid flow experiment)

Visualizing Large Datasets with IndeX

Mouse heart sample tomography

SSC-REMOTEVIS

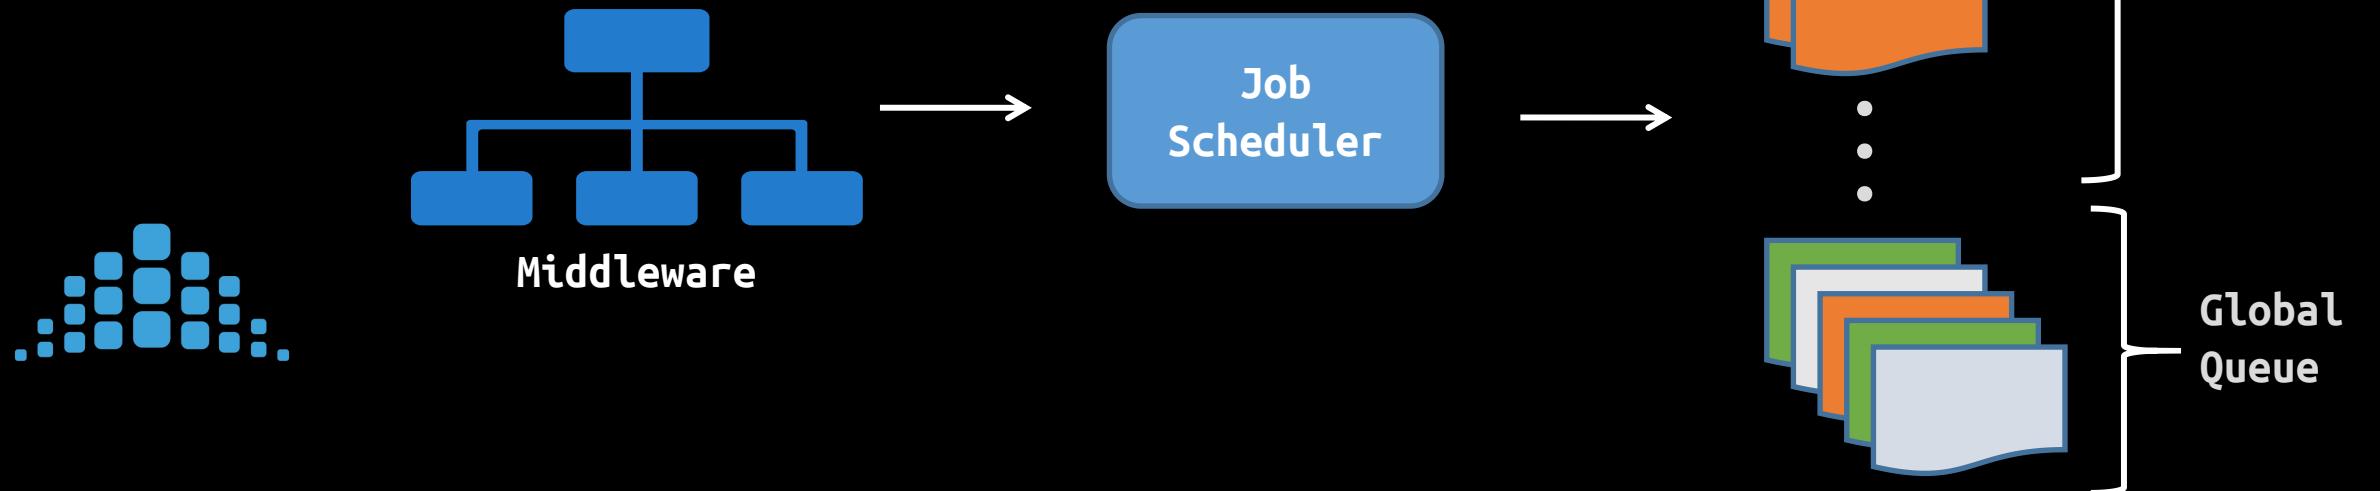

RemoteVis Scheduler

Queue visualization requests

Guarantees greater resource availability

Abstracts the complex mechanisms of visualization scheduling

Extensible Scheduler backend (Process/Slurm)

Jupyter Notebook

- Simple API for RemoteVis
- Allow quick data analysis
- Integration with Python ecosystem

Request a remote visualization server instance from middleware

```
In [3]: # If an instance already exists for my user
ce = rv.query_visualization_server(middleware_host, middleware_port)

# If no instance is found (i.e., instance is None), we request a new one from the middleware
instance = None
stance = rv.initialize_visualization_server(middleware_host, middleware_port, shape=(2048, 2048, 2048), dtype='uint16')
```

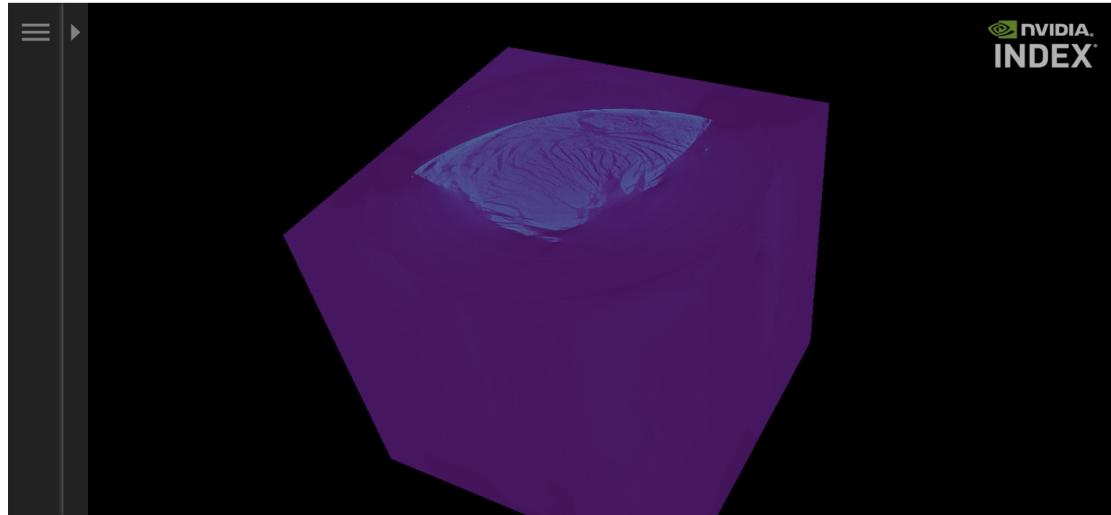

Render volume remotely on IndeX using RDMA-based data transfer (no disk involved)

```
In [5]: print(instance.visualization_server_url)
http://harriet.lnls.br:54680
```

```
In [6]: rv.render_volume(volume, instance)
Out[6]: True
```

Load IndeX HTML viewer as IFrame

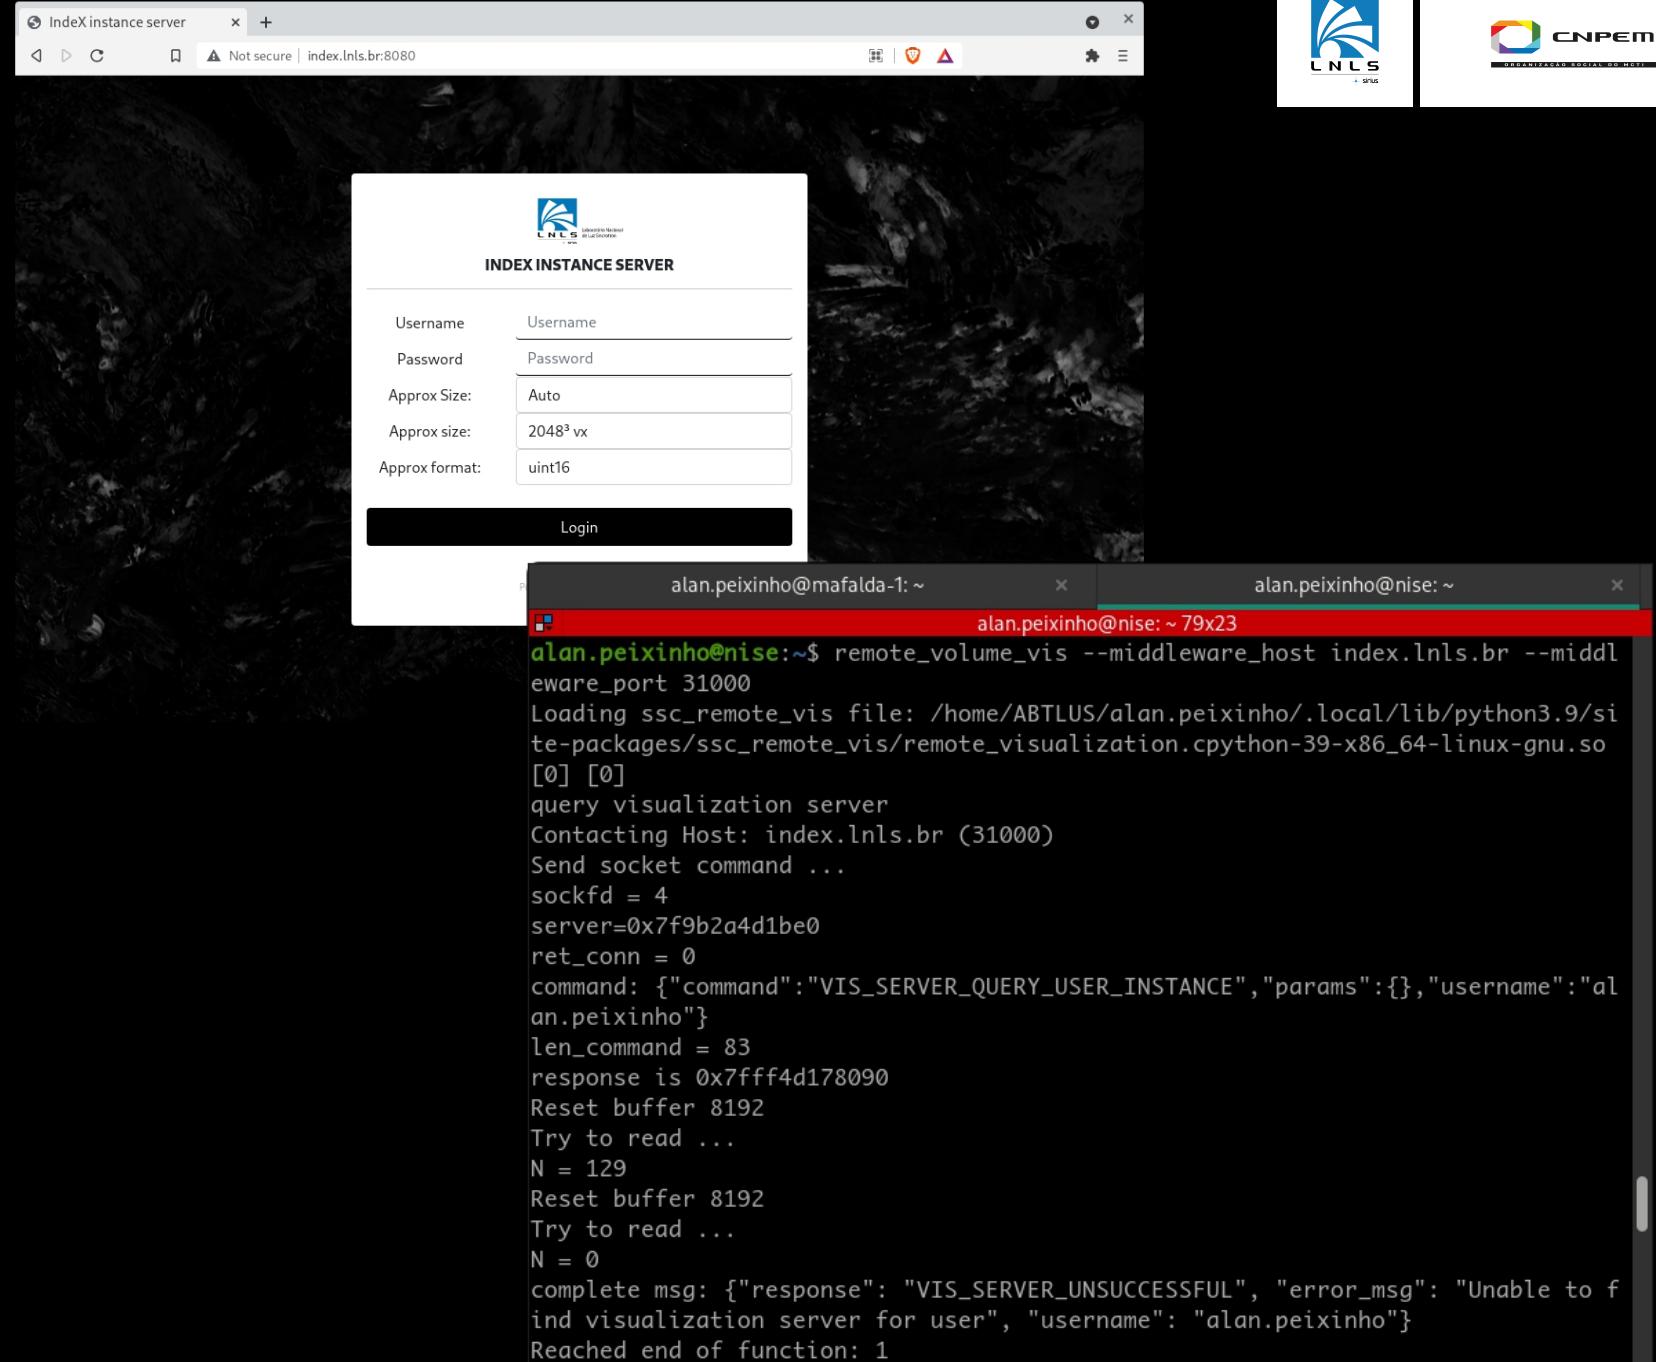

```
In [11]: IFrame(instance.visualization_server_url, width=900, height=450)
Out[11]:
```

Web Interface/CLI

Simpler interface

Volumes load from disk

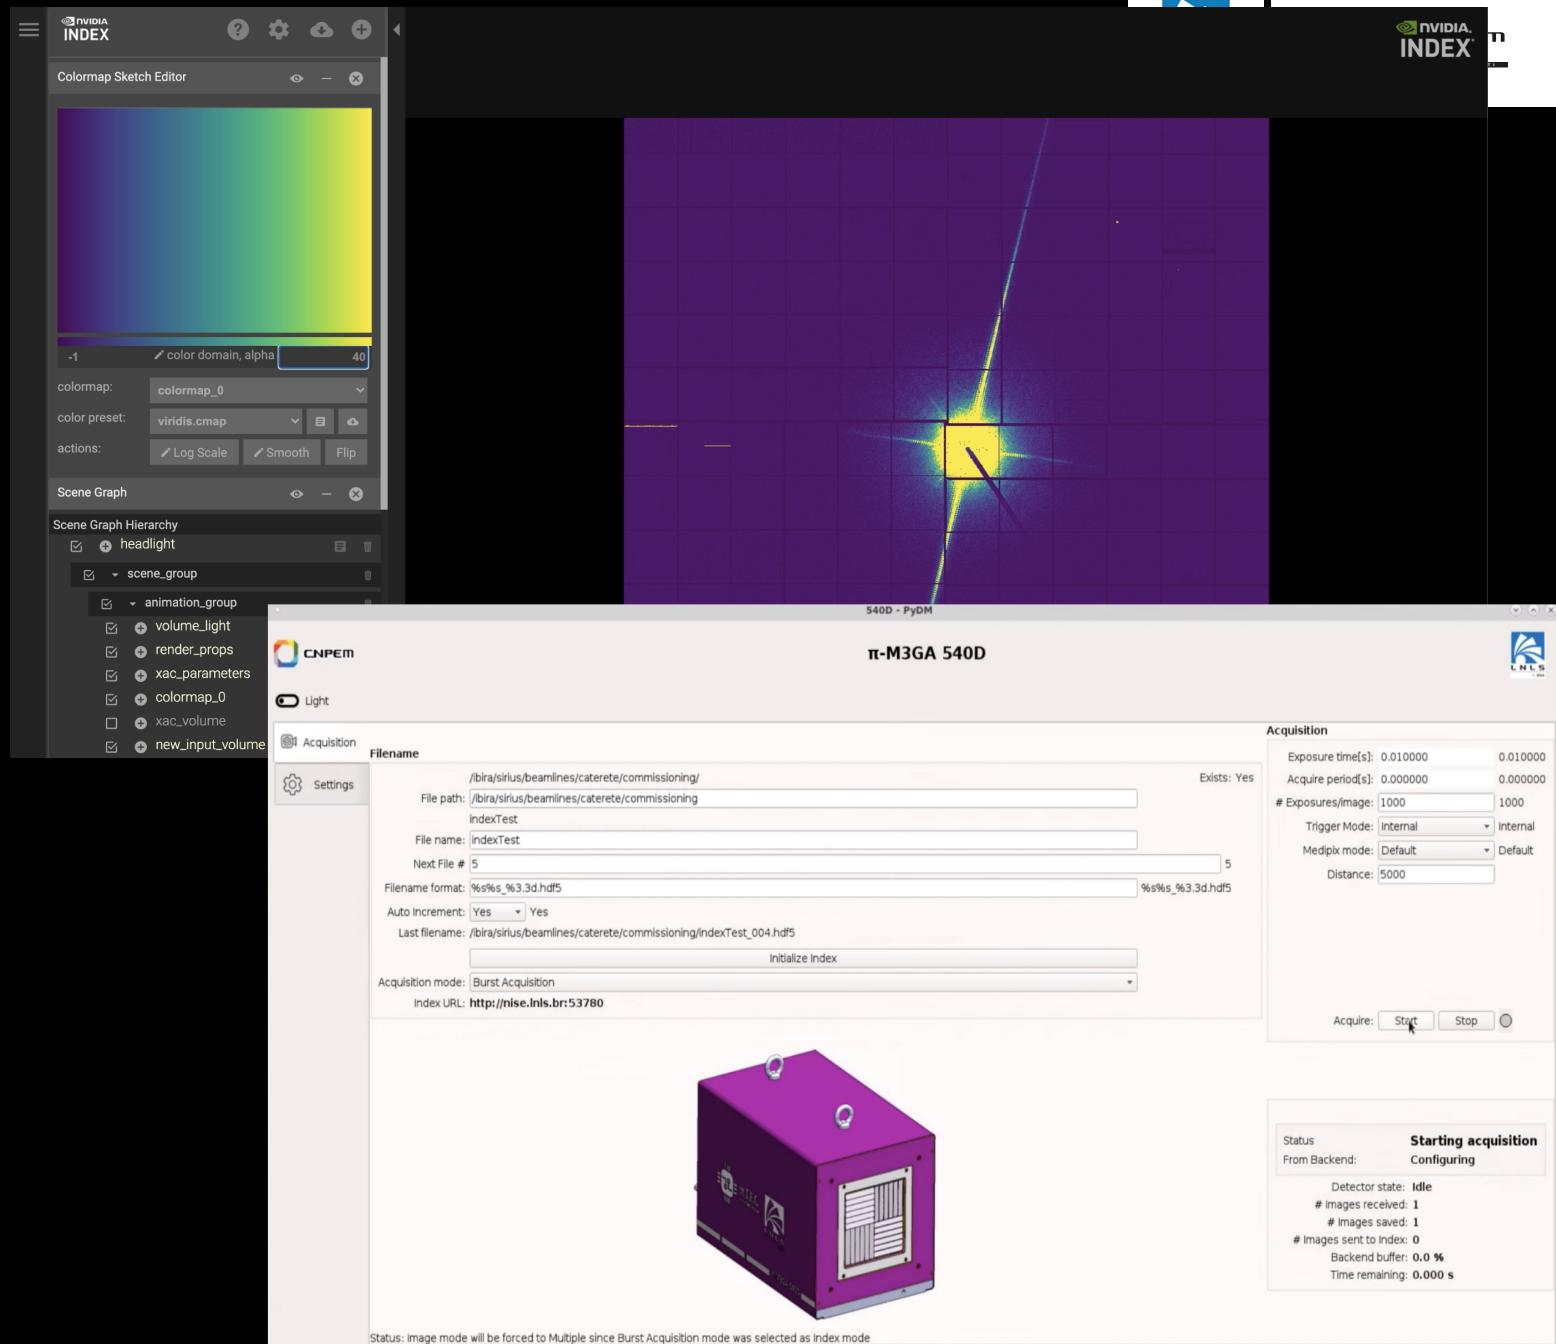

The screenshot displays a desktop environment with two main windows. At the top is a web browser window titled 'IndeXinstance server' with the URL 'index.lnls.br:8080'. The page content is a login form for 'INDEX INSTANCE SERVER' with fields for 'Username' (labeled 'User'), 'Password', 'Approx Size:' (set to 'Auto'), 'Approx size:' (set to '2048³ vx'), and 'Approx format:' (set to 'uint16'). A 'Login' button is at the bottom of the form. Below the browser is a terminal window with a dark background. It shows a command being run: 'alan.peixinho@nise:~\$ remote_volume_vis --middleware_host index.lnls.br --middle_ware_port 31000'. The terminal then outputs a series of log messages related to connecting to a visualization server at port 31000, sending socket commands, and attempting to read data. The final message indicates that the function reached its end.

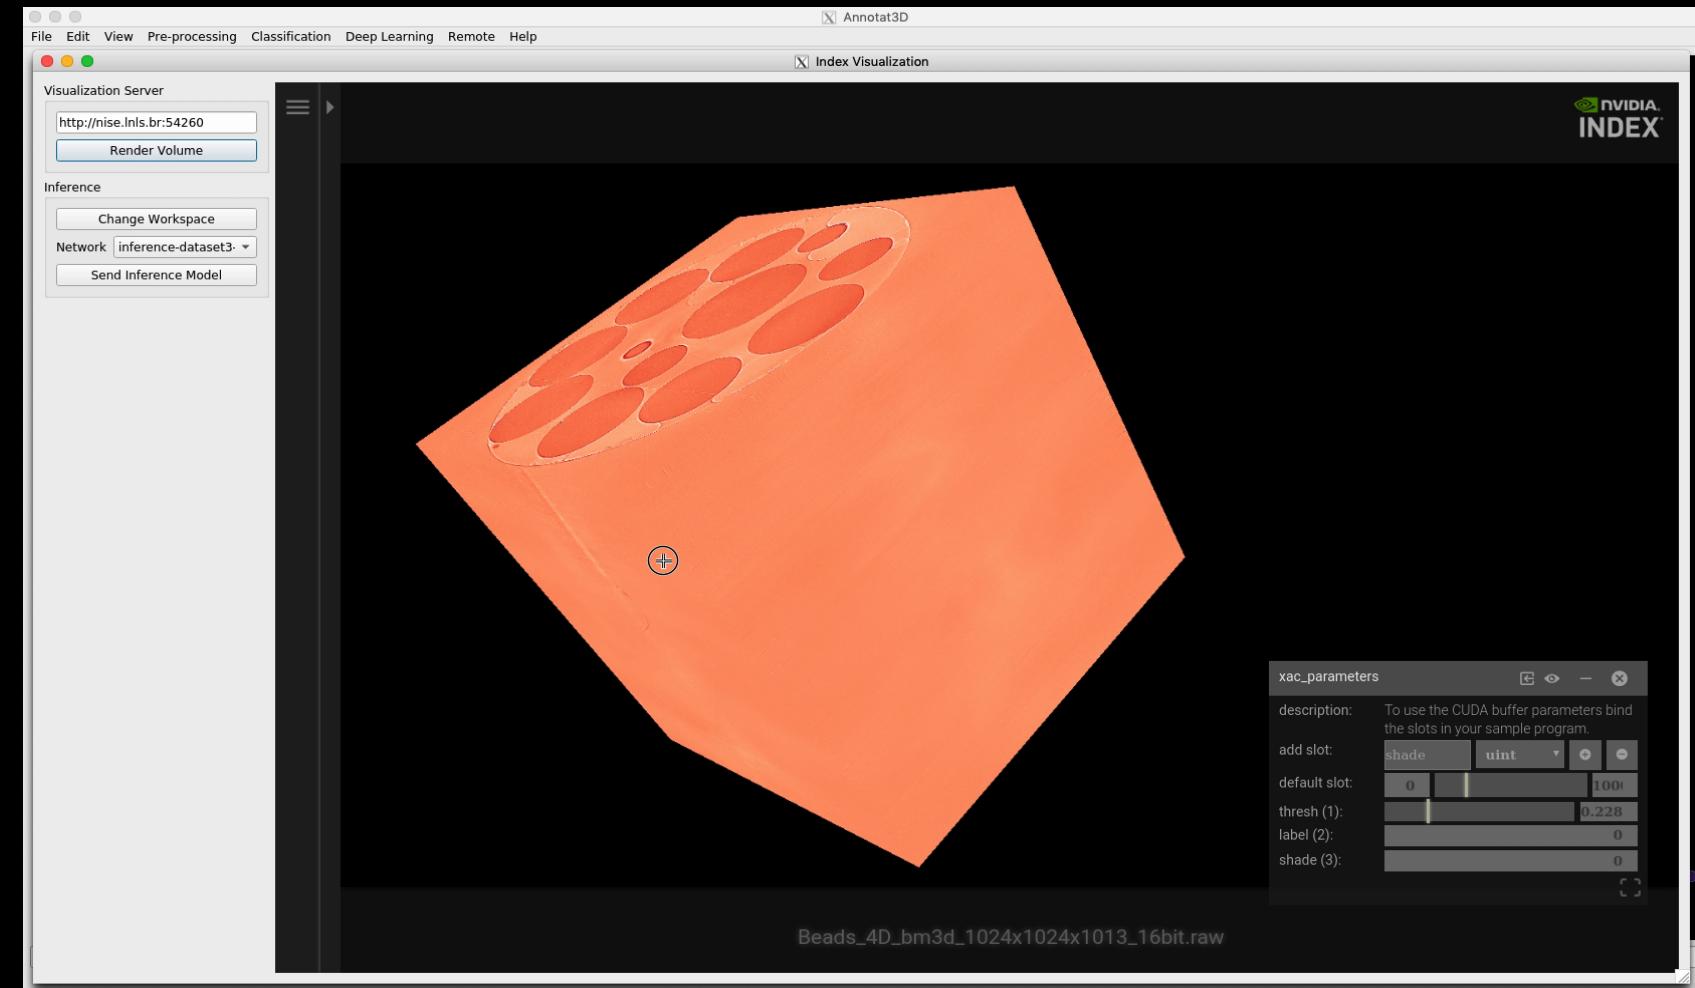

```
alan.peixinho@nise:~$ remote_volume_vis --middleware_host index.lnls.br --middle_ware_port 31000
Loading ssc_remote_vis file: /home/ABTLUS/alan.peixinho/.local/lib/python3.9/site-packages/ssc_remote_vis/remote_visualization.cpython-39-x86_64-linux-gnu.so

```

Detector

- On site visualization of reconstructed images
- Facilitates parameters fine adjustments
- Allow users to preprocess data during visualization
-

Annotat3D

Bidirectional communication

Analyze regions of interest
on big volumes

Annotate/train models and
sent back to IndeX

thank you all!

Thanks for scientific examples provided: Ema and Mogno beamlines, LNBio.

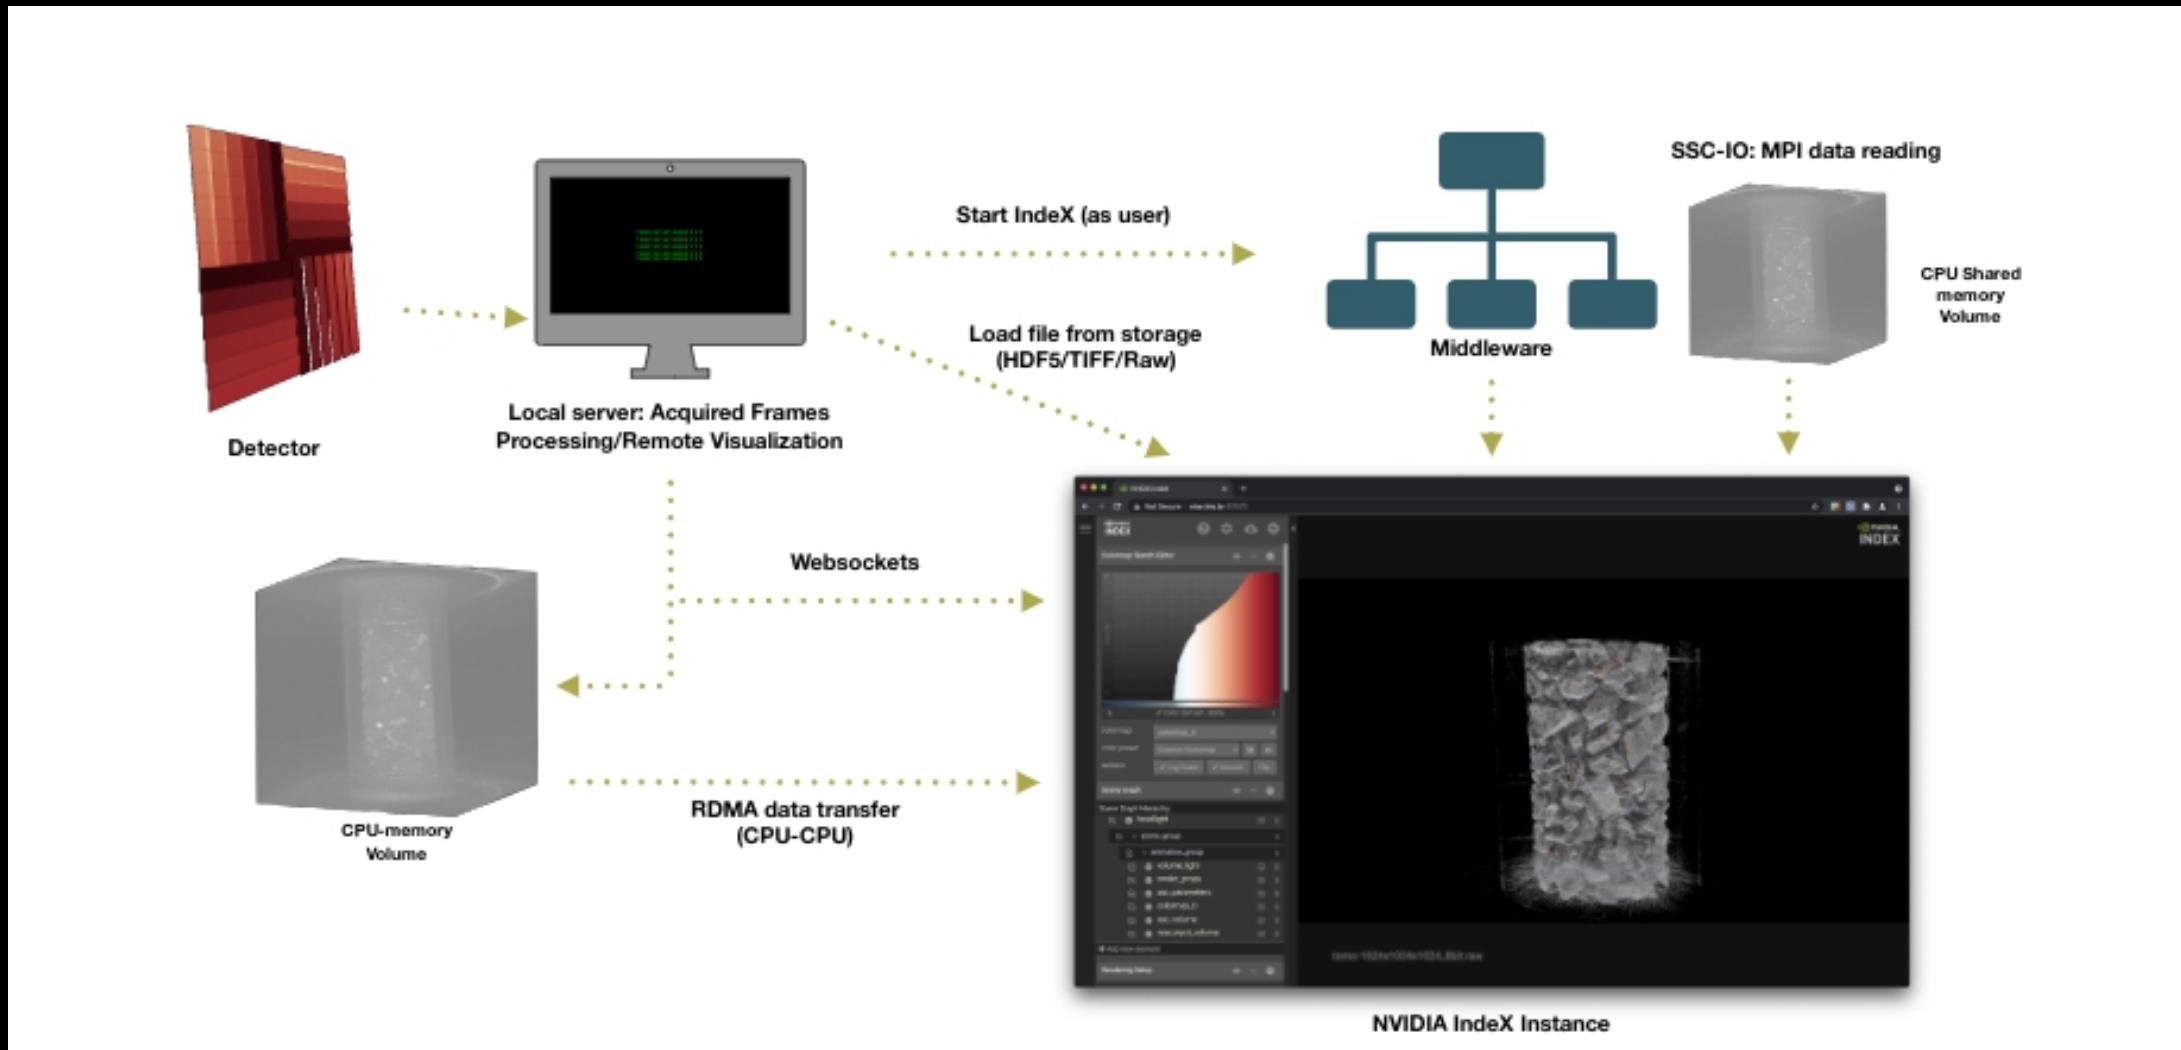

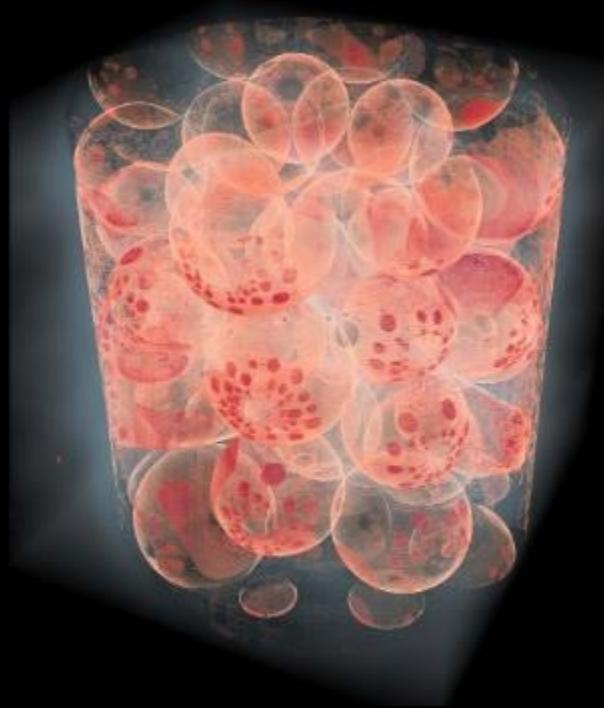

Figure 1: The proposed remote visualization workflow using the RemoteVis library to send volumes into NVIDIA IndeXfor visualization, via RDMA data transfer.

# vx	P9 ₅₀ to DGX	DGX to P9 ₅₀	DGX to DGX
1024 ³	0.87 ± 0.01	1.13 ± 0.20	0.86 ± 1.48
1536 ³	2.58 ± 0.09	3.00 ± 0.65	2.53 ± 0.47
2048 ³	5.99 ± 0.09	7.17 ± 1.47	5.98 ± 1.12
3072 ³	20.30 ± 0.26	21.89 ± 4.90	19.16 ± 3.66

Table 1: RDMA-based data transfer times using SSC-RDMA. Three settings were tested between three different servers, one IBM Power 9 and two NVIDIA DGX-A100. The IBM Power 9 (P950) is connected at 50 Gb/s to the NVIDIA DGX-A100 while the connection between the DGX servers is at 100 Gb/s. The selected volumes are of type float 32 bits (4 bytes per voxel) and vary in number of voxels. All times are in seconds. For DGX to DGX, the destination server was the same as P950 to DGX.

Figure 2: Soil sample renditions using IndeX XAC operators. (a) The original volume with basic rendering and no shading.(b) The volume rendered with XAC local shading (S1). (c) The more advanced XAC shading scheme with ambient occlusion(S3). Data courtesy: MOGNO beamline/Sirius, LNLS/CNPEM.

a) basic volume rendering

b) local shading (filter-based, S1)

c) on-the-fly single-scattering (S2)

Figure 3: Silica bead fluid flow experiment renditions using IndeX XAC operators. The original image with segmentation of the gas phase is depicted in Figure 4 (left). Data courtesy: MOGNO beamline/Sirius, LNLS/CNPEM.

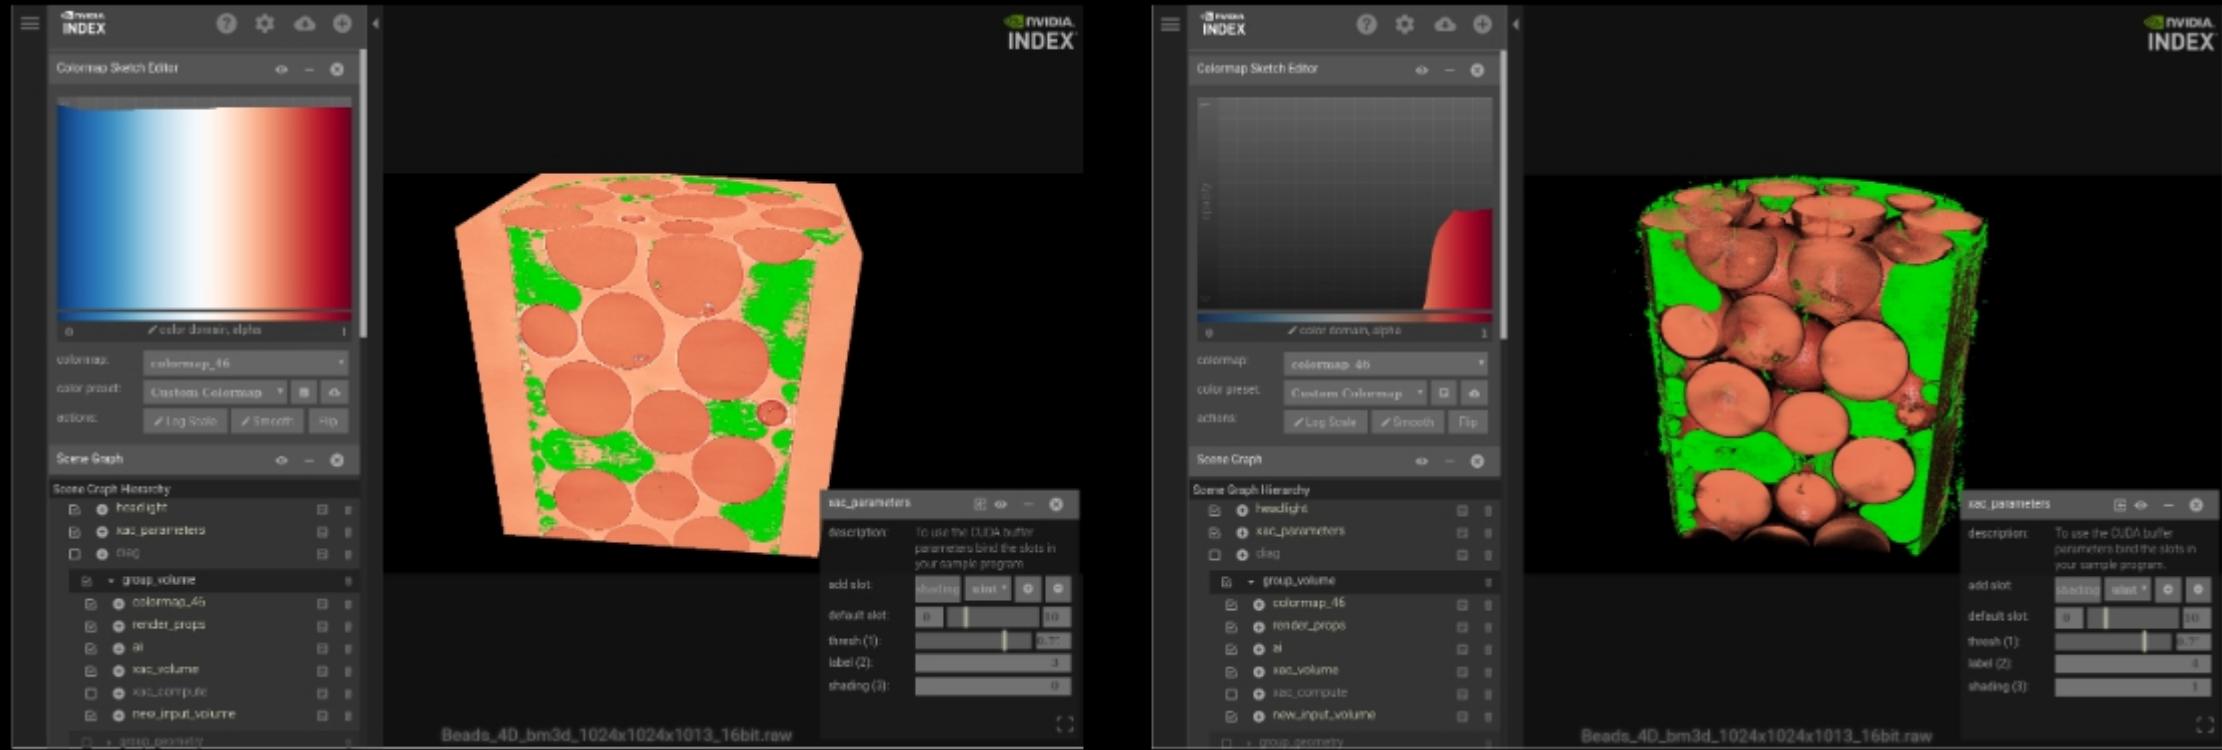

Figure 4: Integration between a pre-trained U-net segmentation model, optimized with NVIDIA TensorRT, and IndeXfor visualization. The TensorRT inference engine is called to segment the gas phase of the sample (left) and the result is immediately used in the 3D rendering (right). Data courtesy: MOGNO beamline/Sirius, LNLS/CNPEM.

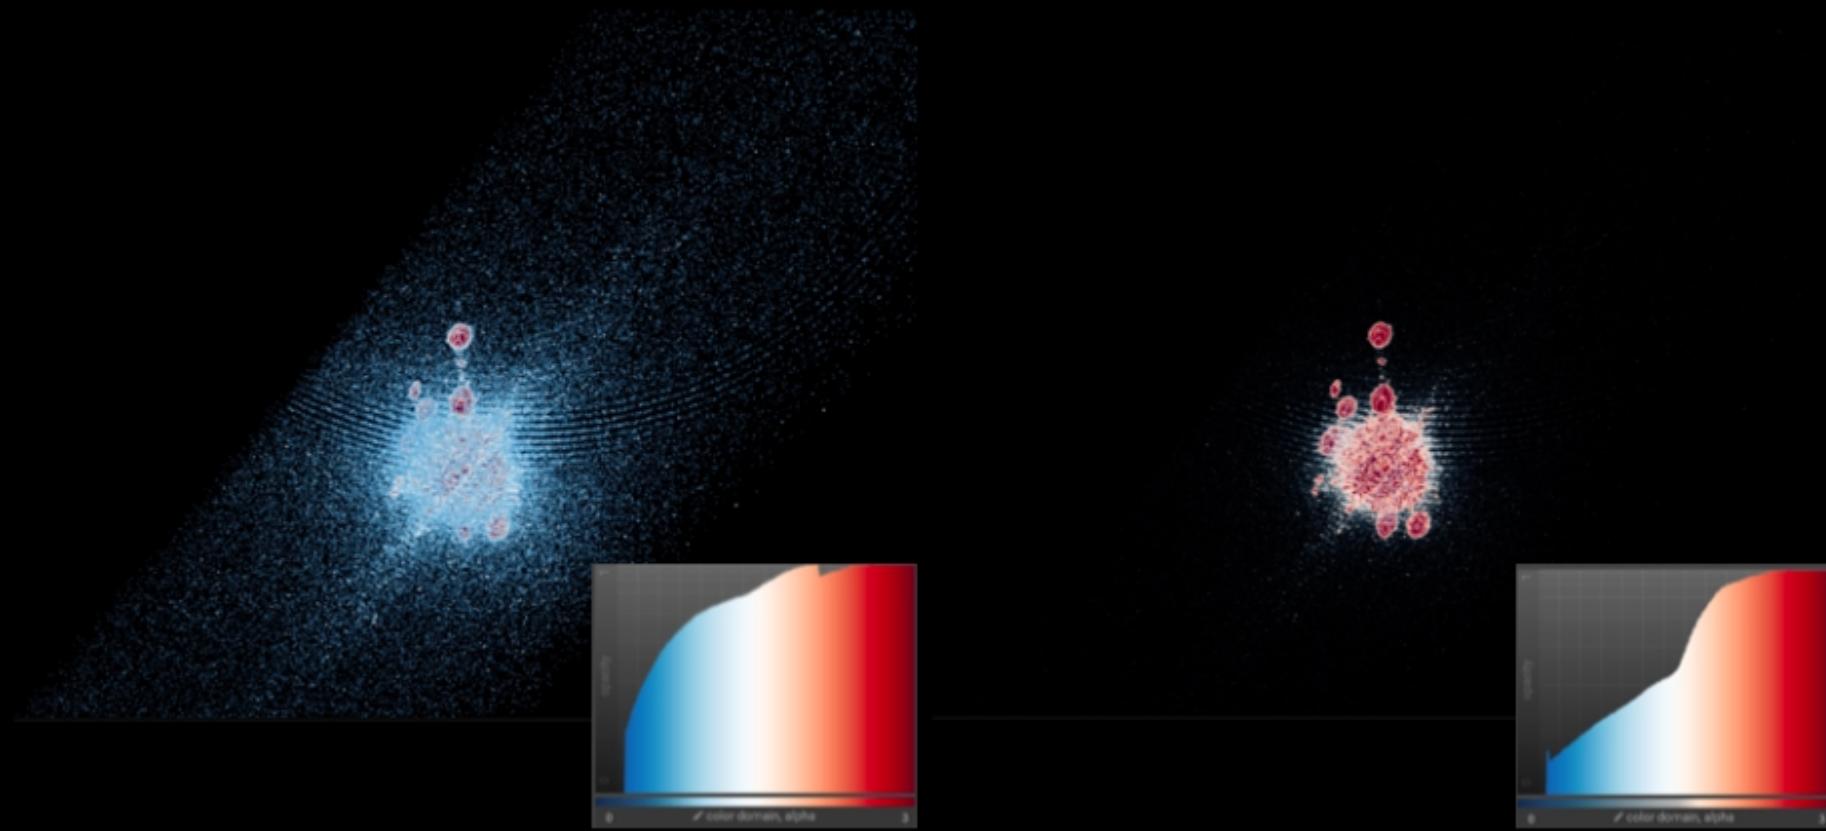

Figure 5: Point cloud renditions by NVIDIA IndeX as a particle volume. The XYZ and point value data are transferred by RemoteVis using SSC-RDMA and the points are rendered as spheres with radii proportional to their values. The user can then select which points to view based on their radii (left) by simply altering the considered colormap (right). Data courtesy: EMA beamline/Sirius, LNLS/CNPEM.
