

Beam Instrumentation Performances through the ESRF-EBS Commissioning

Laura Torino
On behalf of ESRF diagnostics group

International Beam Instrumentation Conference
14-18 September 2020, Remote

Extremely Brilliant Source – EBS

The aim of EBS is to increase the source **brilliance** and the **coherent fraction**
→ **Hybrid Multi-Bend Achromat Lattice**

Requests:

- Reduce the horizontal equilibrium emittance from 4 nm to 140 pm
- Maintain the existing beamlines
- Preserve the time structure operation and a multi-bunch current of 200 mA
- Keep the present injector complex and reuse existing hardware
- Limit the downtime for installation and commissioning to less than 18 months

J. Biasci et al. Synchrotron Radiation News, vol. 27, Iss. 6, 2014

P. Raimondi, THPPA3, IPAC'17

Extremely Brilliant Source – EBS

The aim of EBS is to increase the source **brilliance** and the **coherent fraction**
→ **Hybrid Multi-Bend Achromat Lattice**

Requests:

- Reduce the horizontal equilibrium emittance from 4 nm to 140 pm ✓
- Maintain the existing beamlines ✓
- Preserve the time structure operation and a multi-bunch current of 200 mA ✓
- Keep the present injector complex and reuse existing hardware ✓
- Limit the downtime for installation and commissioning to less than 18 months ✓

J. Biasci et al. Synchrotron Radiation News, vol. 27, Iss. 6, 2014

P. Raimondi, THPPA3, IPAC'17

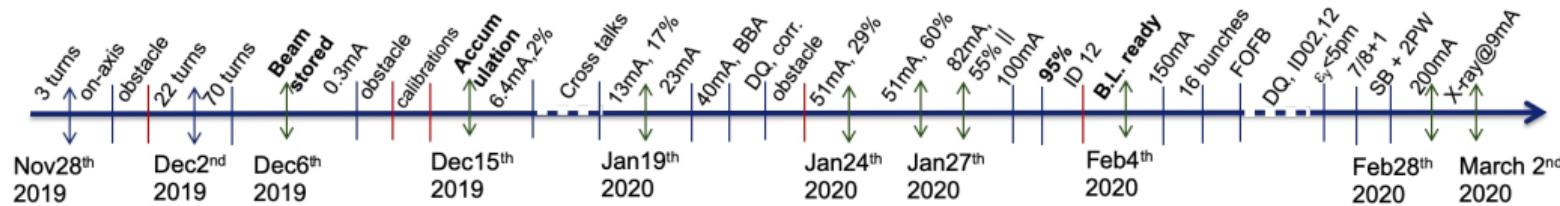

L. Torino et Al, MOAO03, IBIC'19

The European Synchrotron

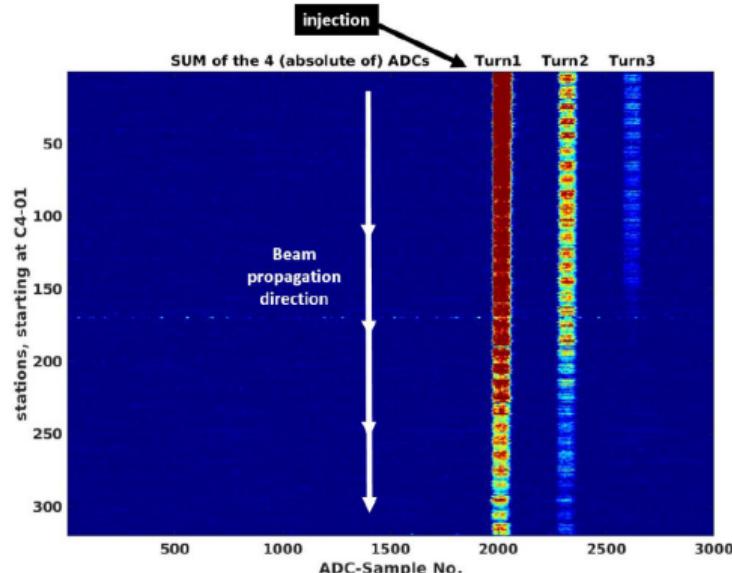

EBS Commissioning Time-Line

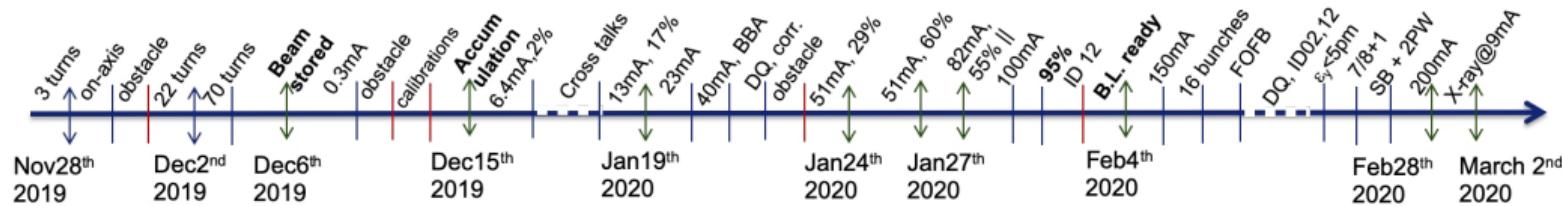

■ Nov. 28th: First injection

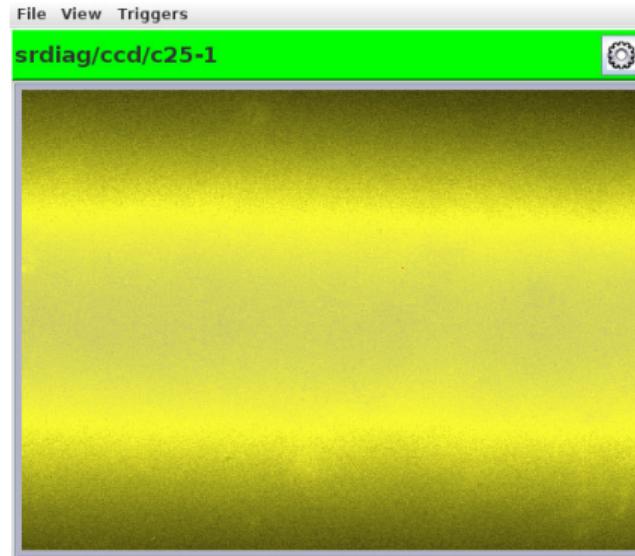

- 3 turns!
- On-axis injection
- Orbit and tune measurement show evidence of problems with the magnets calibration and cross talk
- Evidence of an obstacle in cell 23

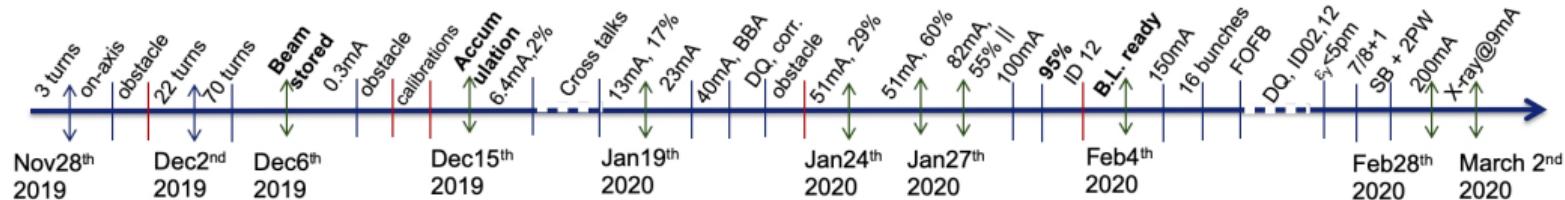

EBS Commissioning Time-Line

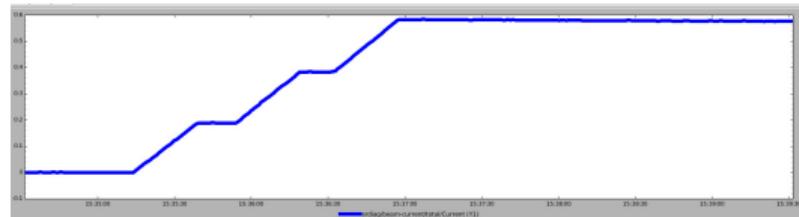

- Nov. 28th: First injection
- Dec. 5th: Beam Stored!
 - Steering implementation using BPMs and correctors
 - First synchrotron light observed
 - Second obstacle found in cell 8
 - Off-axis injection achieved

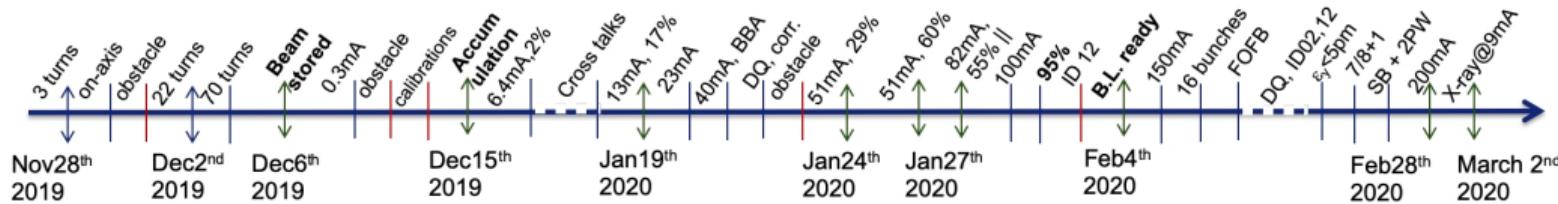

EBS Commissioning Time-Line

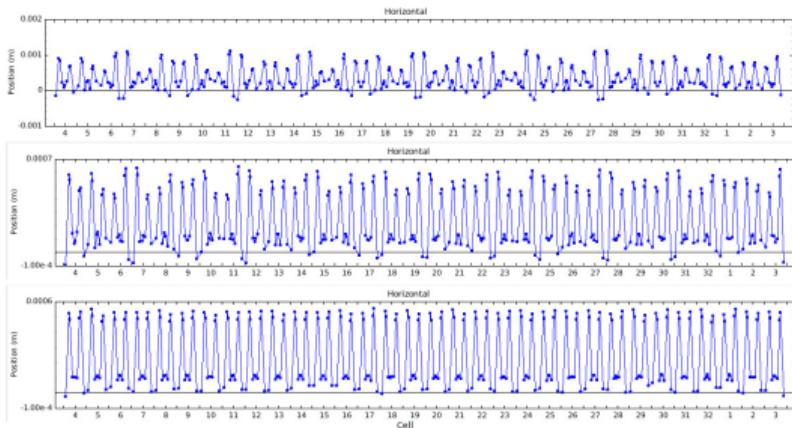

- Nov. 28th: First injection
- Dec. 5th: Beam Stored!
- Dec. 15th: Accumulation!
 - Linear optics optimization
 - Injection optimization... Injection efficiency still quite low

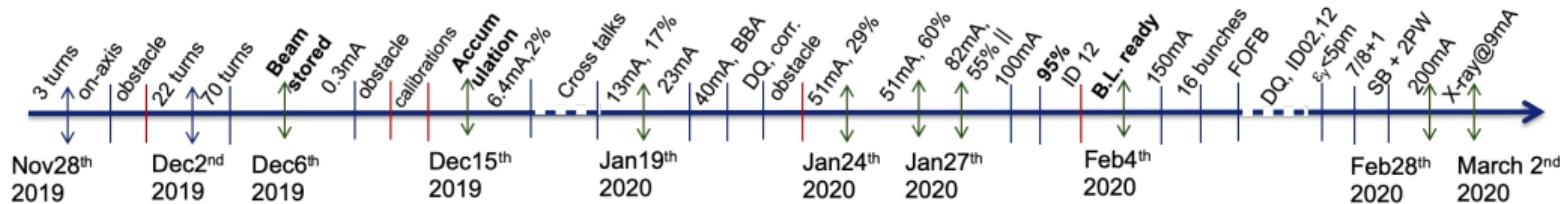

EBS Commissioning Time-Line

- Nov. 28th: First injection
- Dec. 5th: Beam Stored!
- Dec. 15th: Accumulation!
- Dec. 17th - Jan. 17th: Post-Shutdown
 - Dynamic aperture studies
 - Non-linear optics optimization
 - Beam Based Alignment
 - Third obstacle found in cell 5

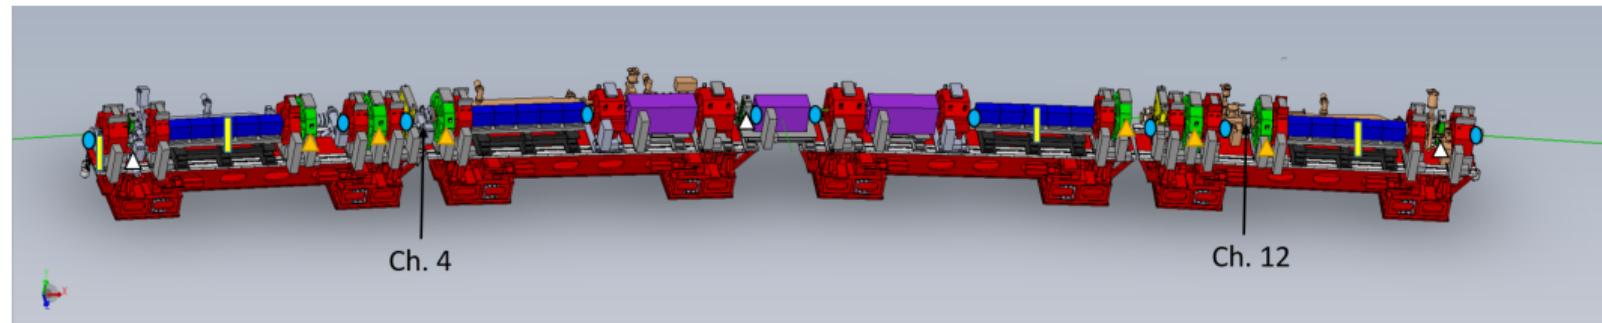

EBS Commissioning Time-Line

- Nov. 28th: First injection
- Dec. 5th: Beam Stored!
- Dec. 15th: Accumulation!
- Dec. 17th - Jan. 17th: Post-Shutdown
- Mar. 2nd: User-mode parameters!
 - 200 mA
 - 95% Injection efficiency
 - 150/10 pm H&V I emittance
 - Feedback on...

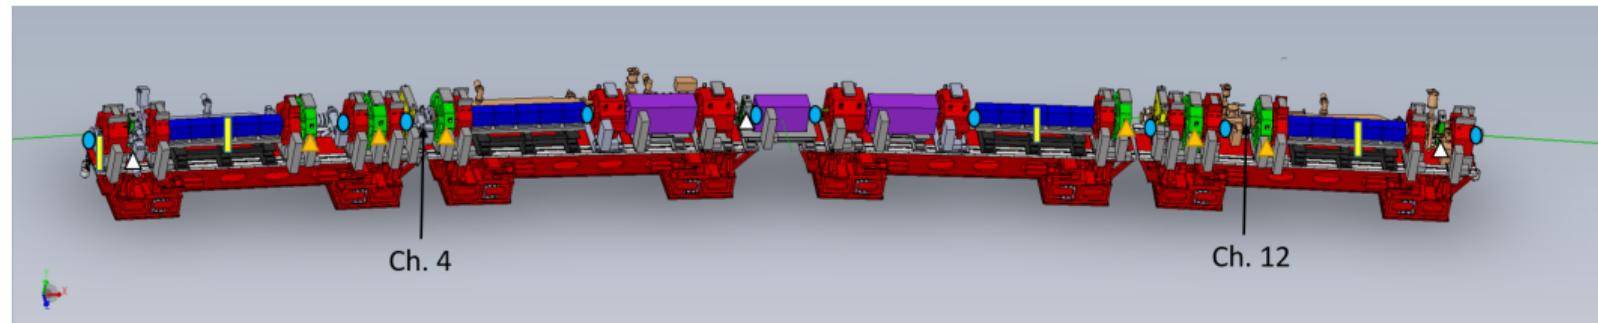

EBS Beam Instrumentation

Quantity	Component
320	BPMs
5	Striplines
9	Correctors
3	Special BPM blocks
6	CTs
128	BLDs
5	Emittance Monitors
1	Bunch Purity Monitor
1	Visible light beamline

- BLD
- BPM
- ▲ Slow Correctors
- △ Fast Correctors
- Ch. 4: Emittance monitor extraction/
Visible light extraction
- Ch. 12: Emittance monitor extraction/
Shakers/ Striplines/CTs

EBS Beam Instrumentation

Beam Position Monitors @ EBS

- 320 BPMs (10 per cell)
 - 192 with Libera-Brilliance electronics (6 per cells) → Slow/Fast Orbit Feedback
 - 128 with Libera Spark electronics (4 per cell) → Slow Orbit Feedback

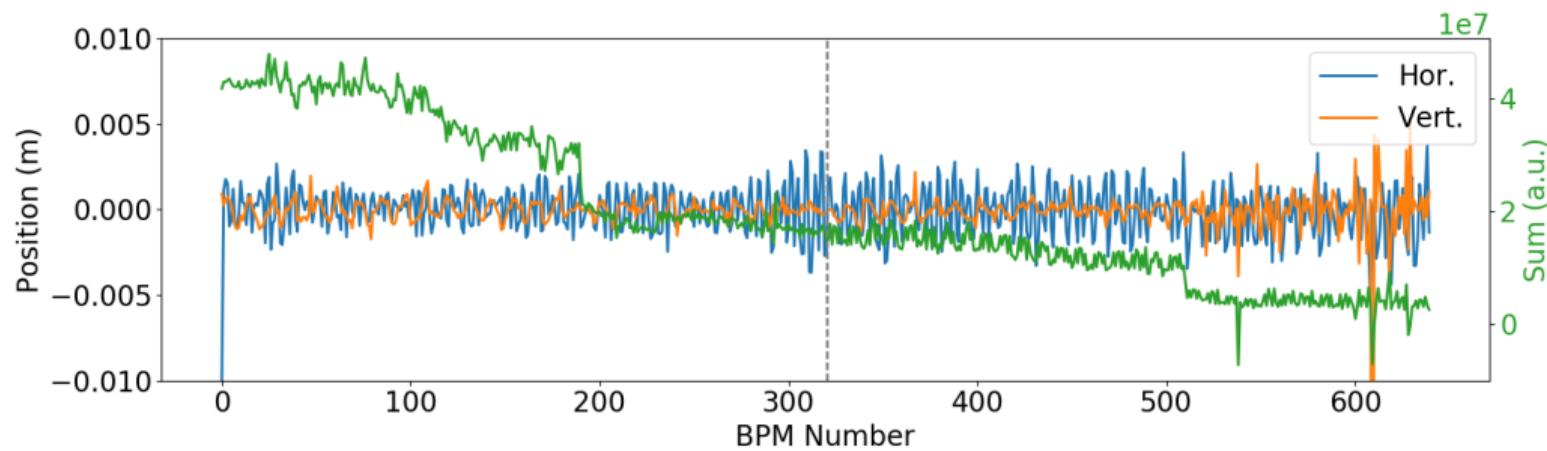

K.B. Scheidt, TUPB02, IBIC'18

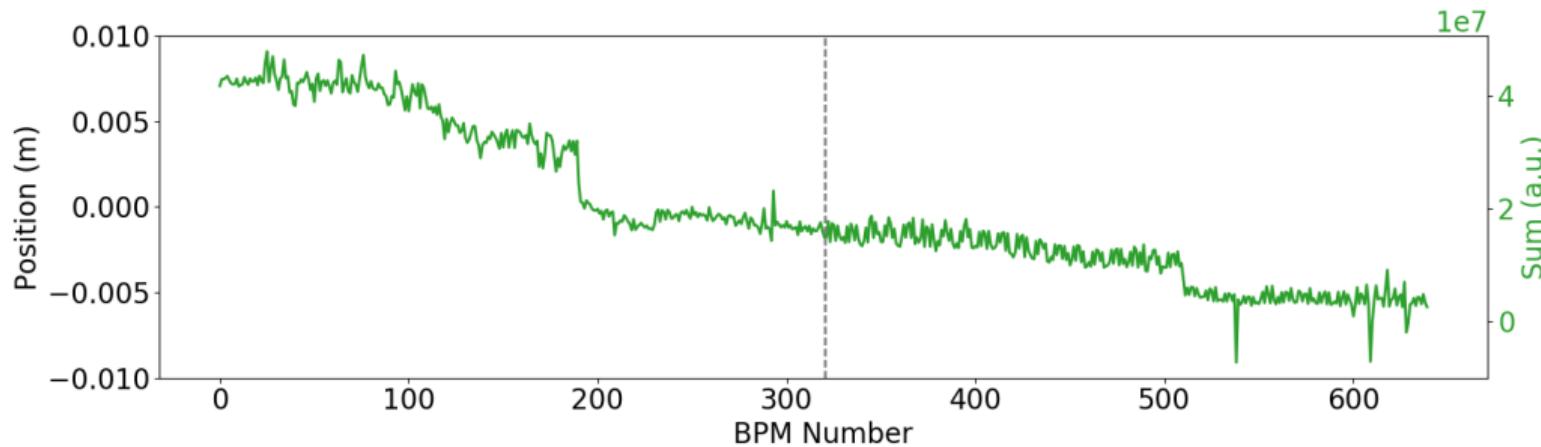

Data-streams, and buffers with identically synchronized sampling-rates

BPMs – First Turns – TBT

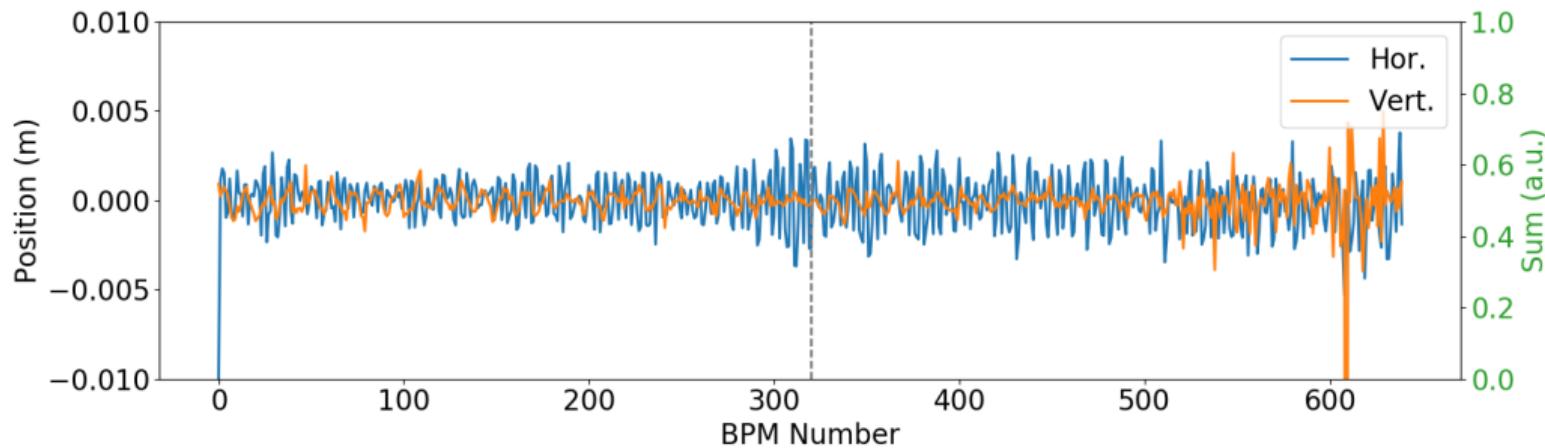

BPMs – First Turns – TBT

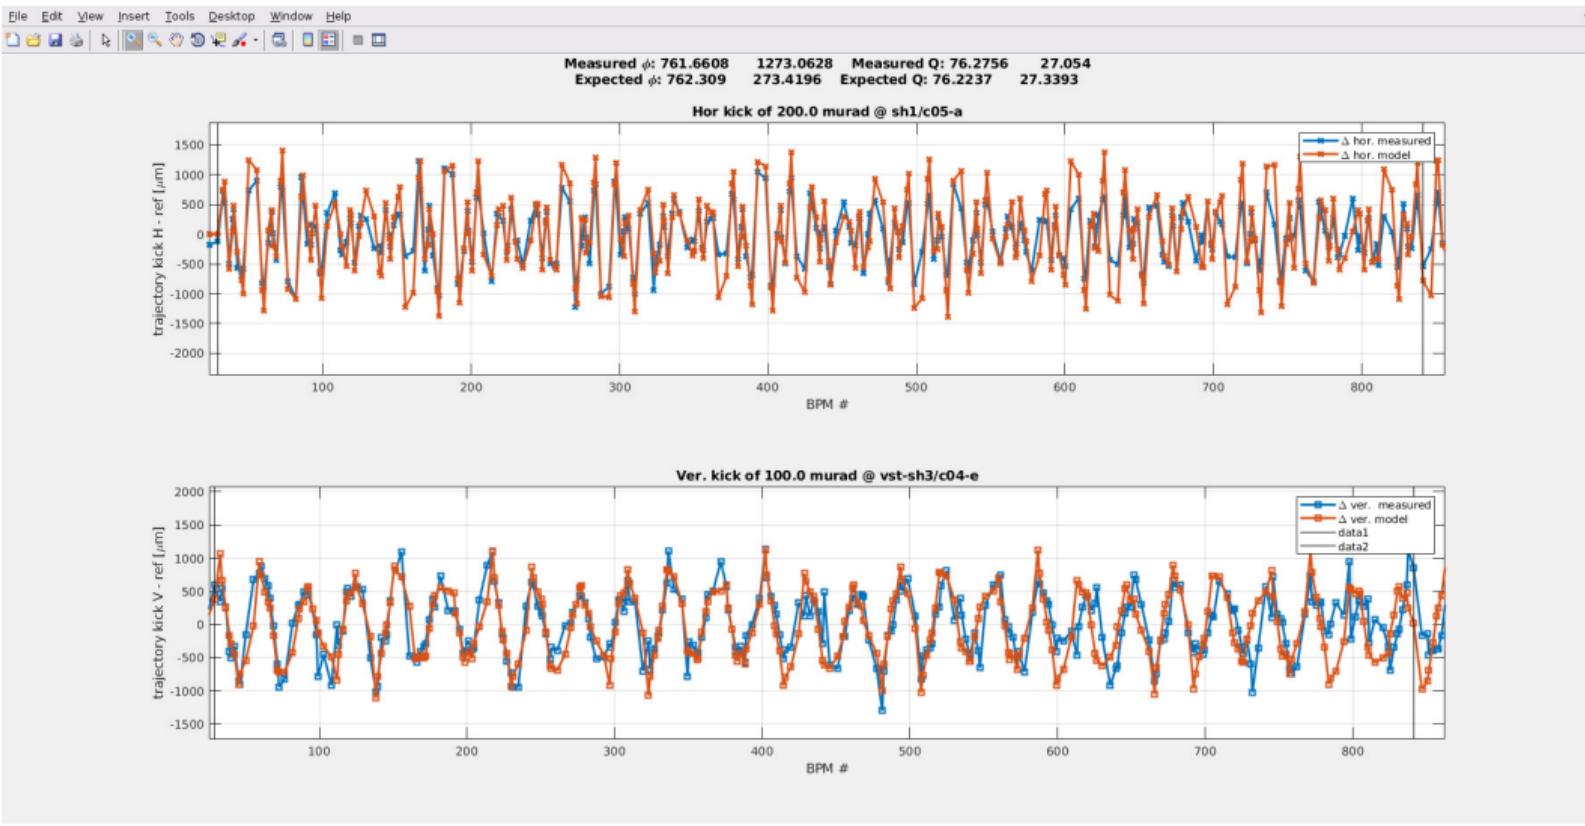

- Sum data to see the progression of the beam along the machine
 - Number of turns
 - Signal proportional to current → check injected current
 - Sudden signal drop → spot obstacles

BPMs – First Turns – TBT

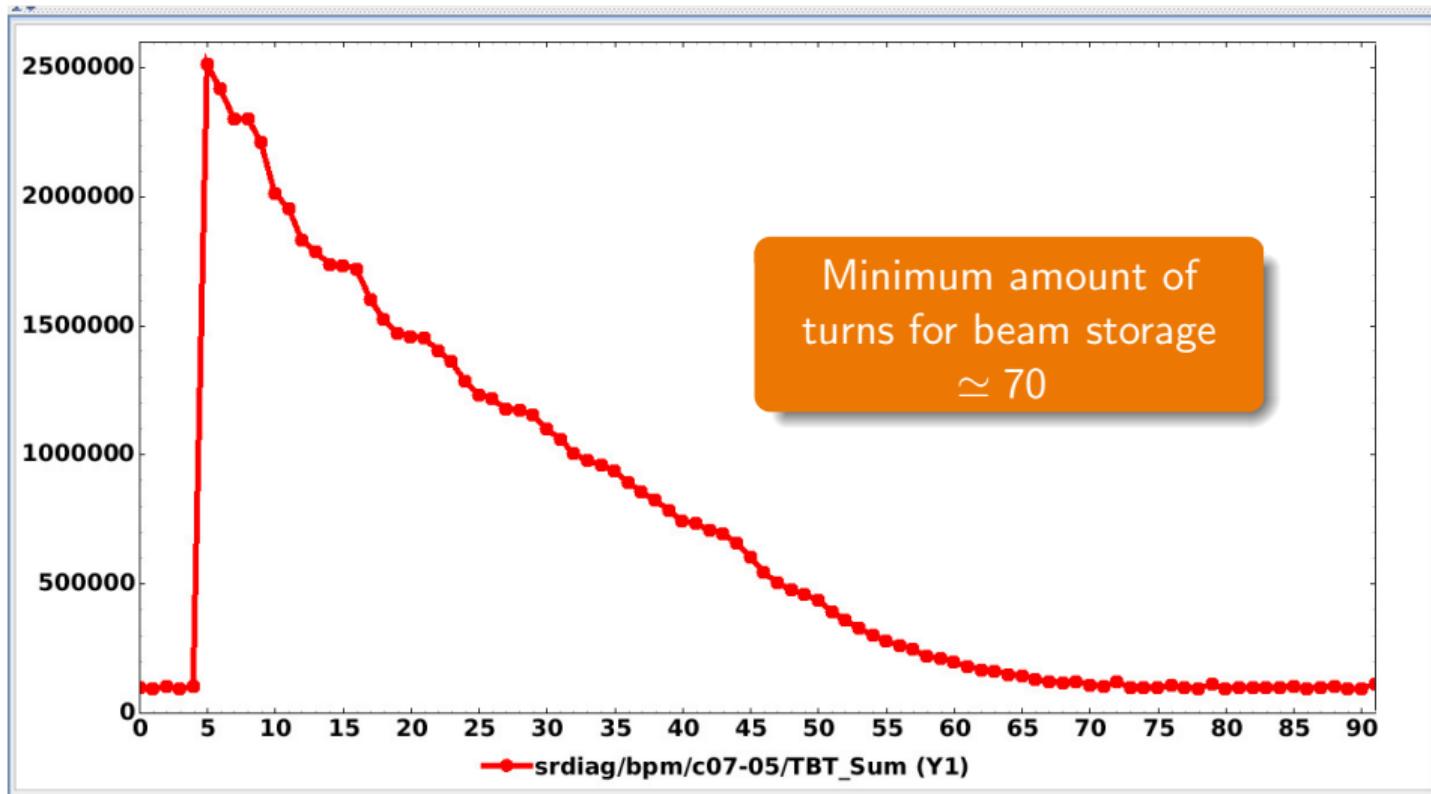

- Sum data to see the progression of the beam along the machine
- Orbit used to correct the lattice
 - TBT orbit measurement @ less than 1 mA injected
 - High excursion → polynomials used to calculate the position
 - Integer tune measurements

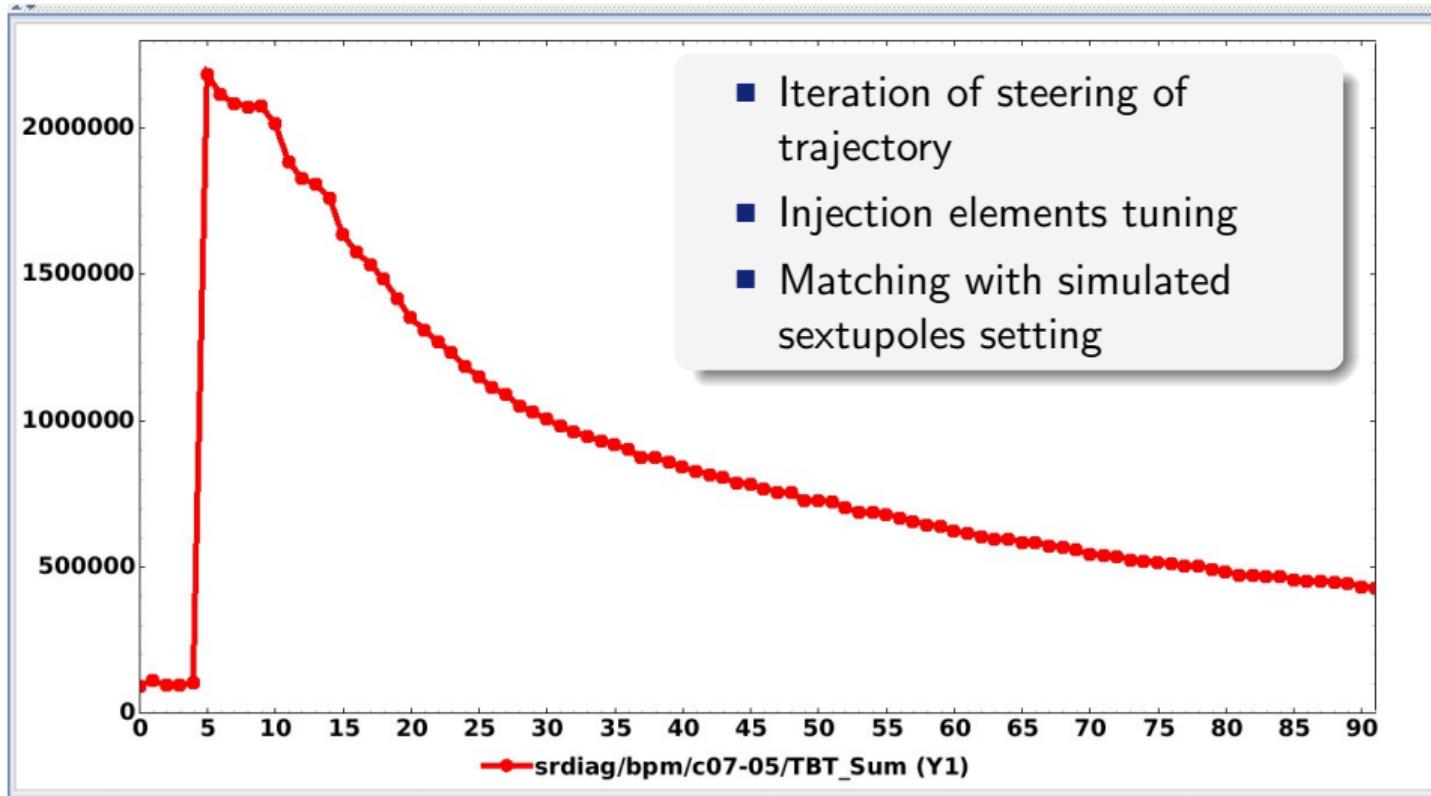

BPMs – First Turns – TBT

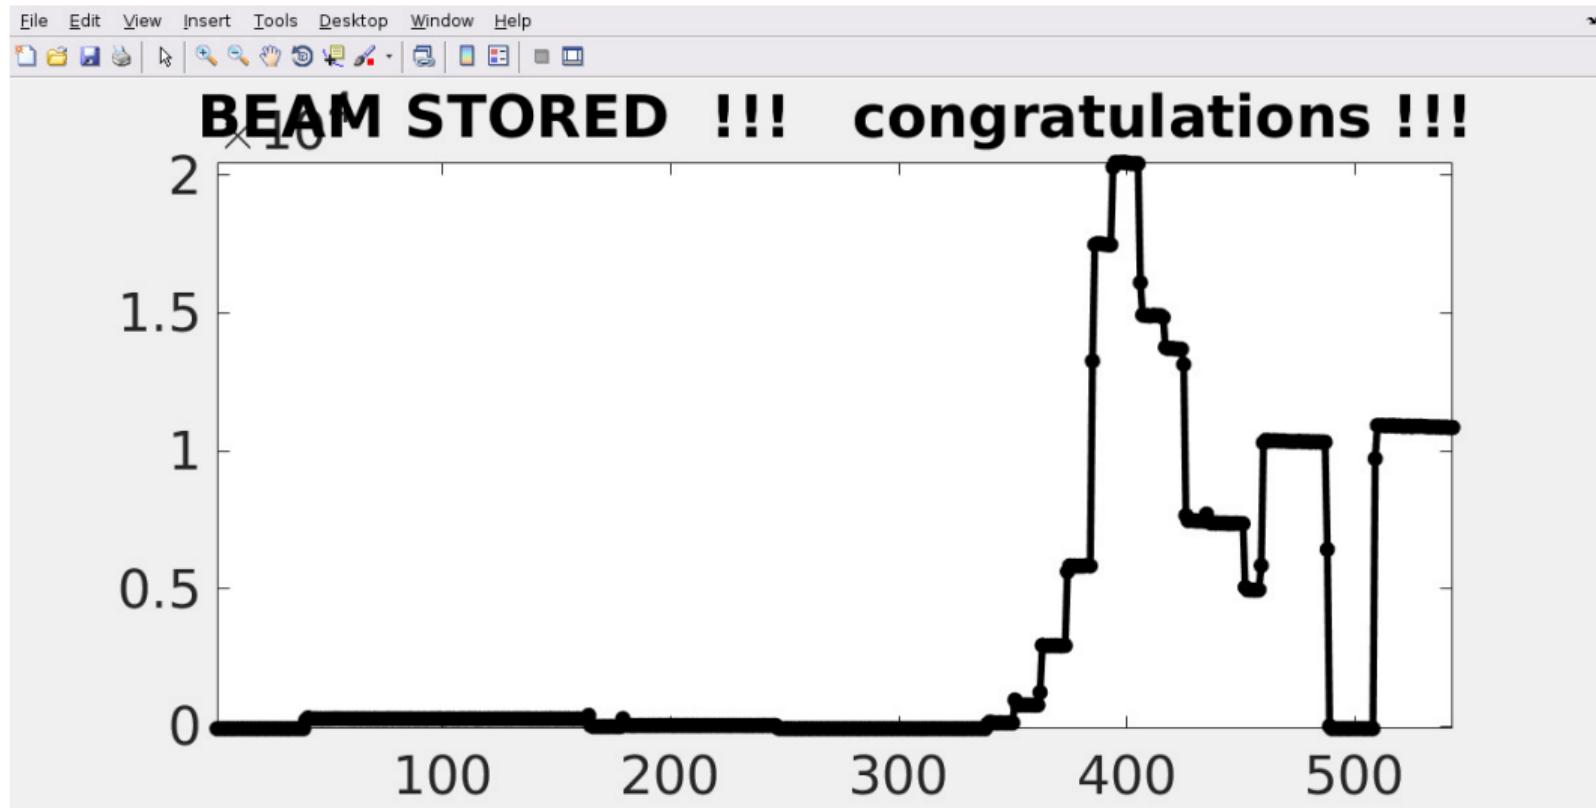

BPMs – RF capture – TBT

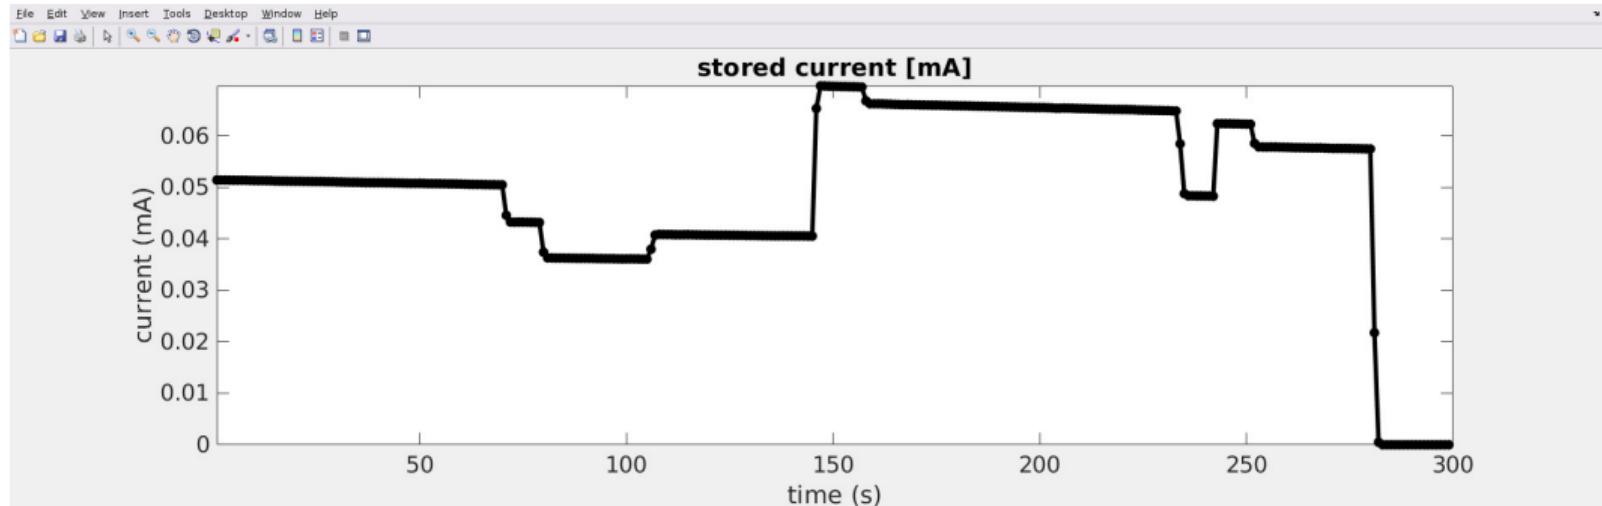

BPMs – RF capture – TBT

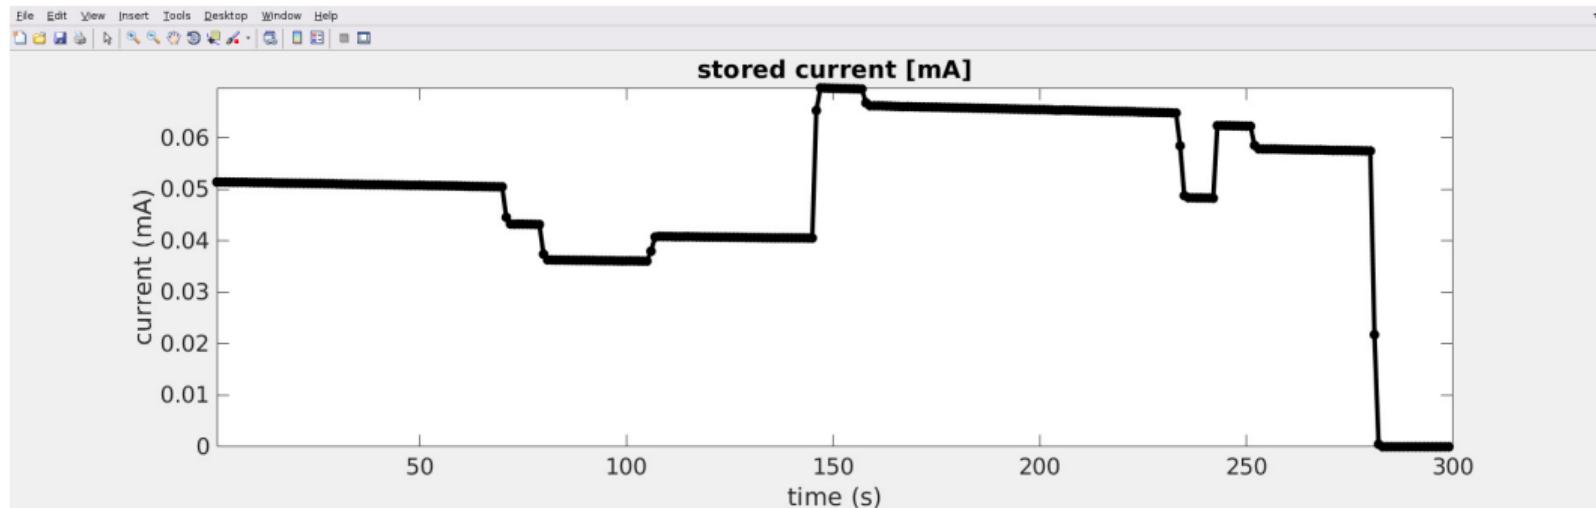

BPMs – Beam Stored – SA

BPMs – Beam Stored – SA

BPMs – Beam Stored – SA

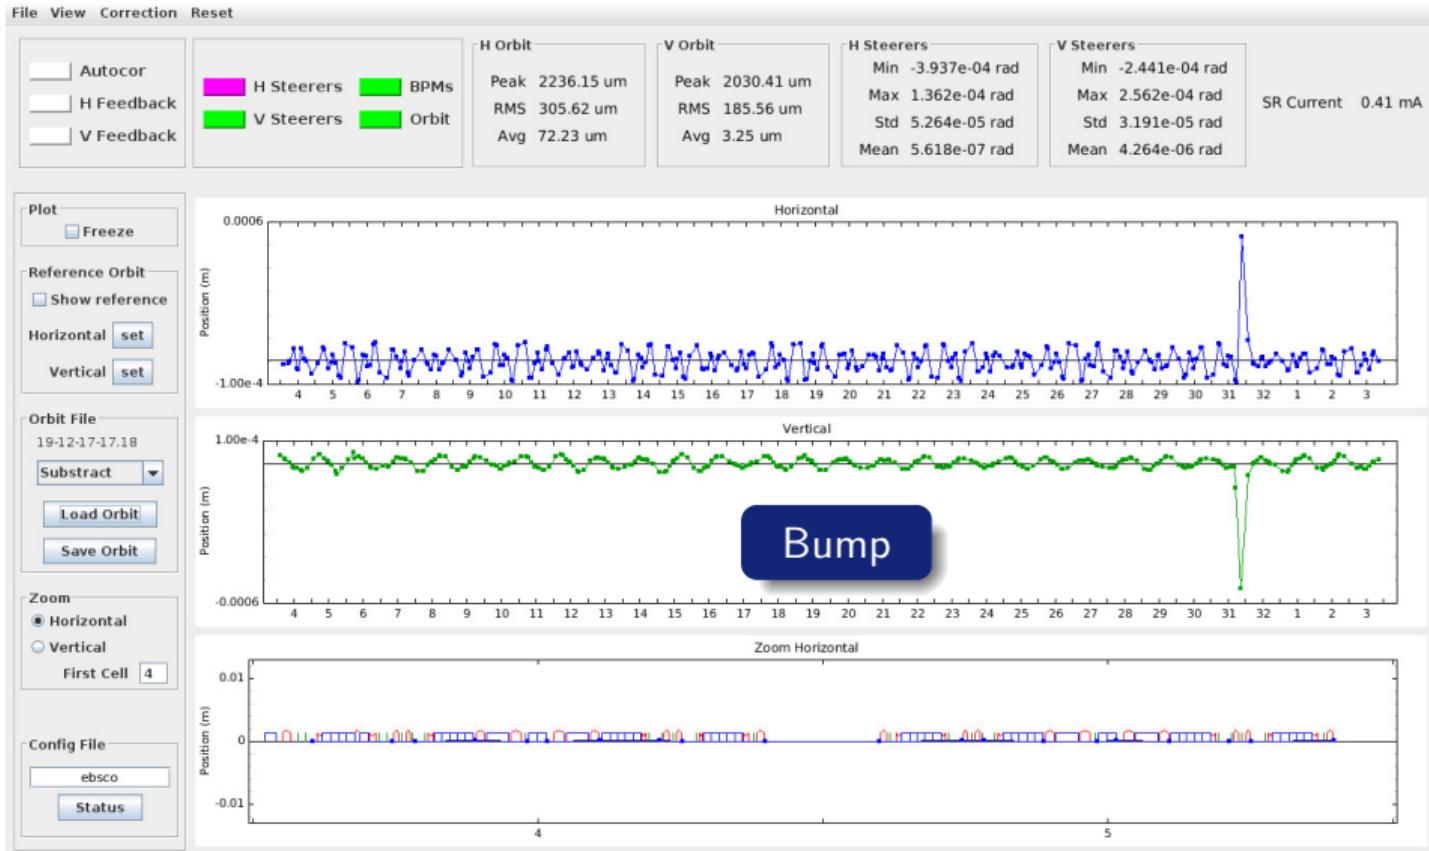

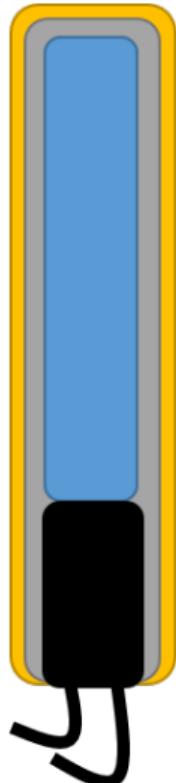

Once the beam was stored it was possible to use the BPMS in a more standard way...

BPMs – Orbit Measurements – SA

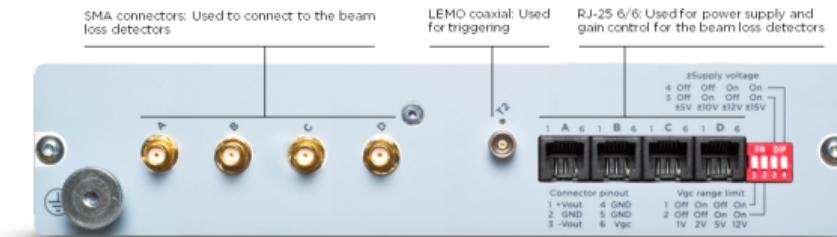

BPMs – Orbit Measurements – SA

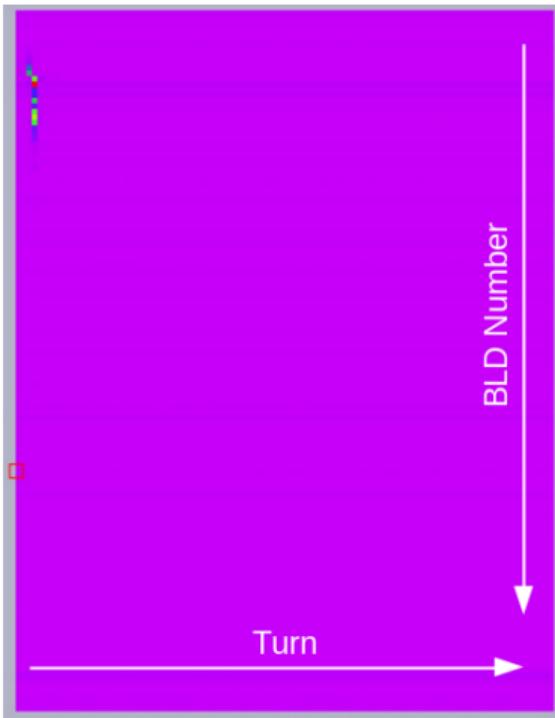

- 128 BLDs PMT+Scintillator+Lead shielding
- Power/Readout electronics Libera-BLM
- 4 BLDs per BLM (32)
- Independent gain and attenuation settings
- Relative calibrated losses
- Capability for almost BbB and full TbT losses measurements

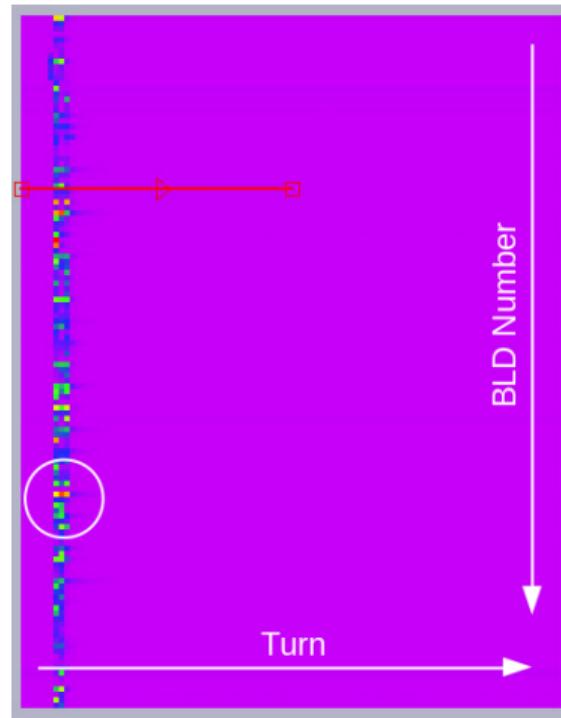

L. Torino, et al., WEOB01, IBIC'18

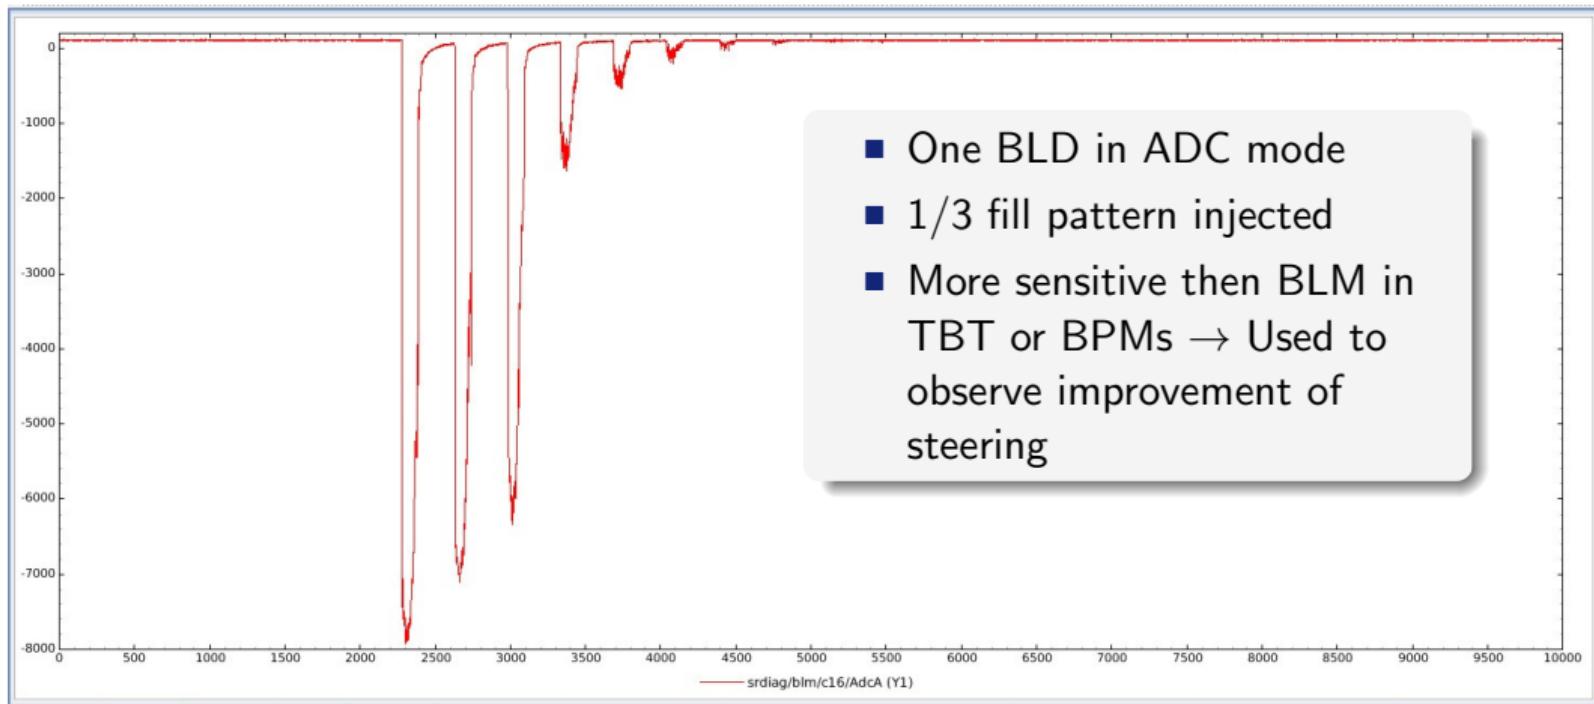

First Injection – Screen in

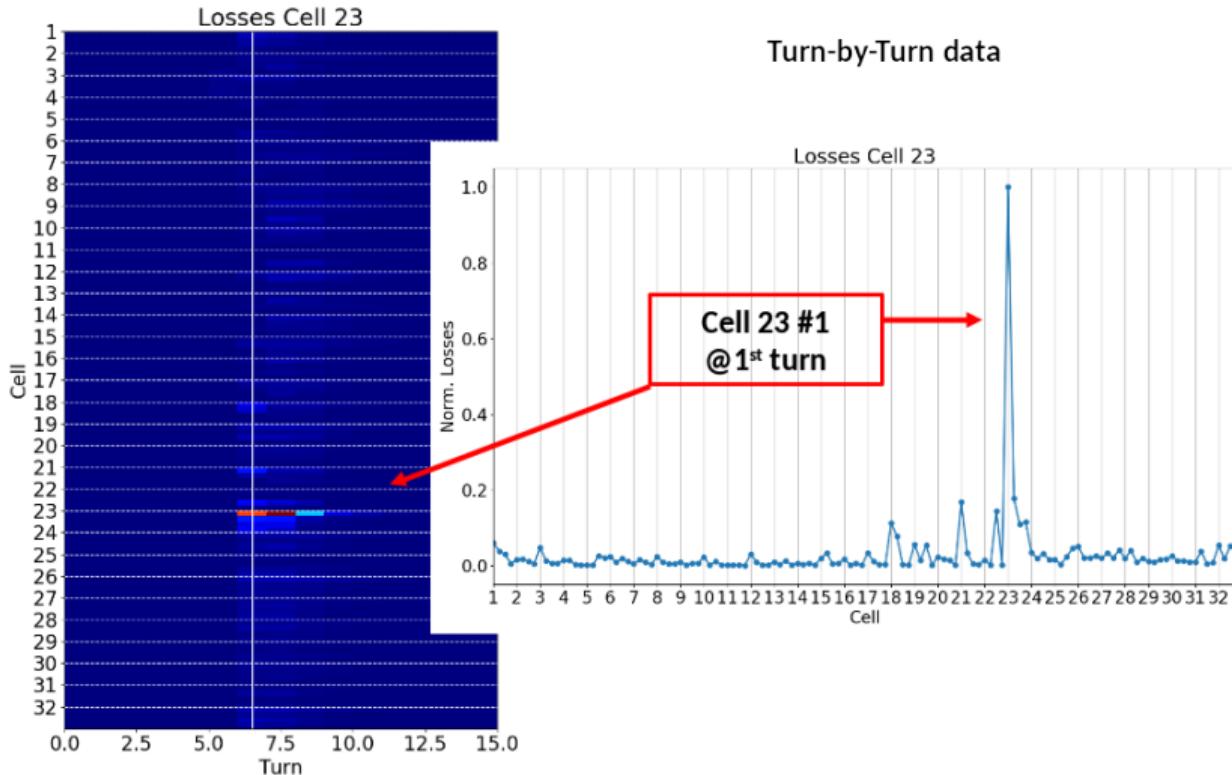

Second Injection – Screen out

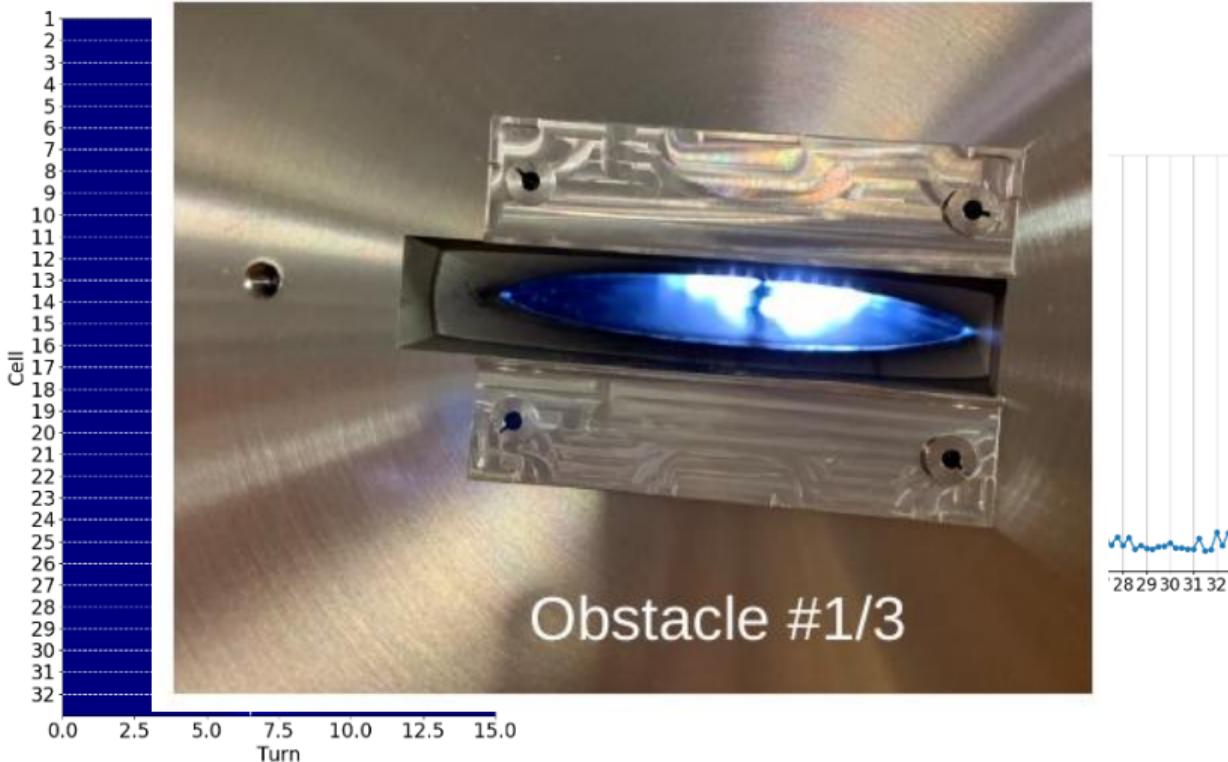

ADC: 352 samples = 1 Turn

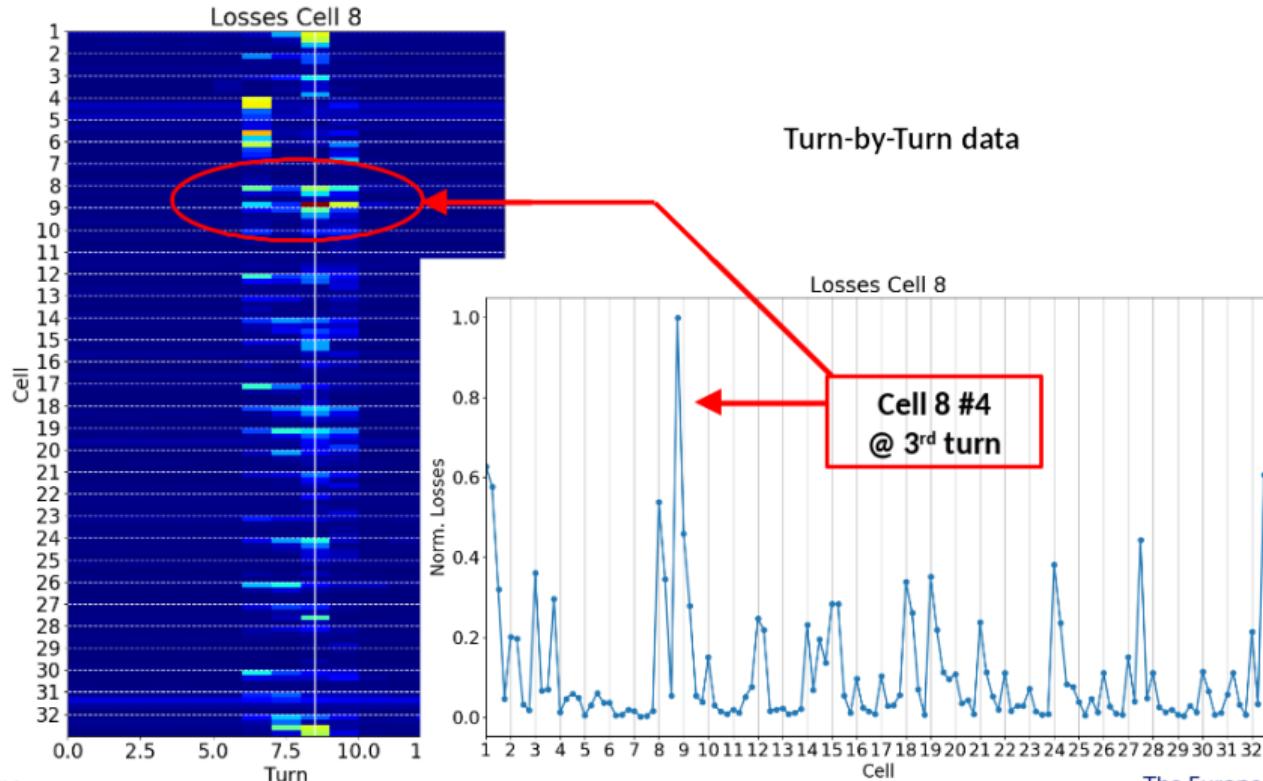

Obstacle 1: ID chamber Cell 23

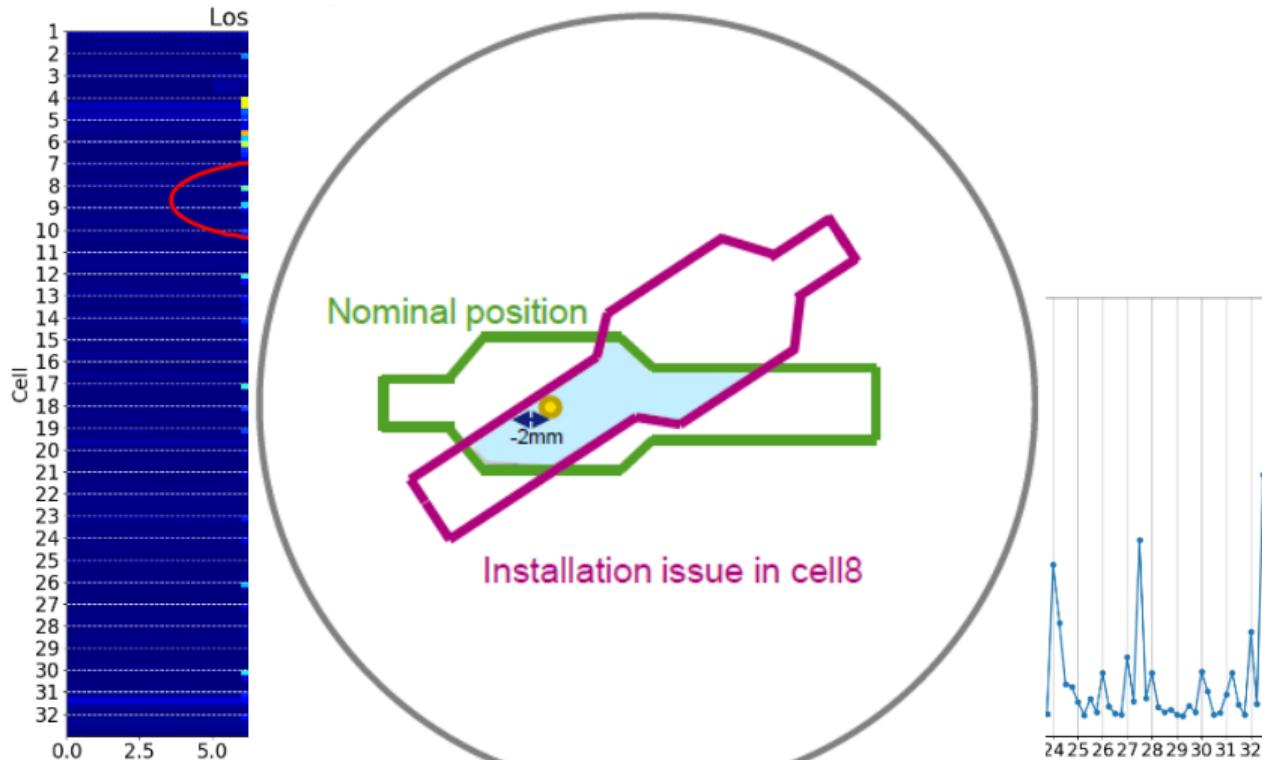

Obstacle 1: ID chamber Cell 23

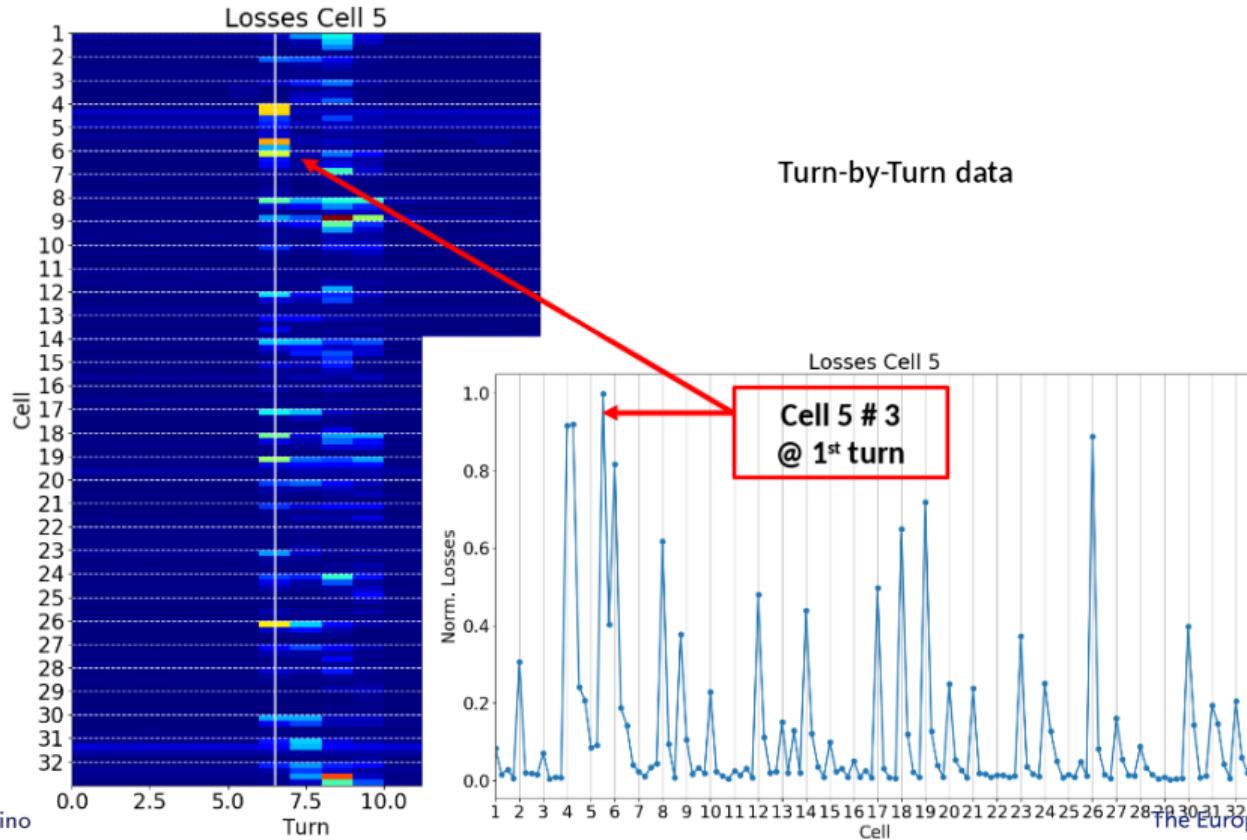

Obstacle 2: Chamber 10 Cell 8

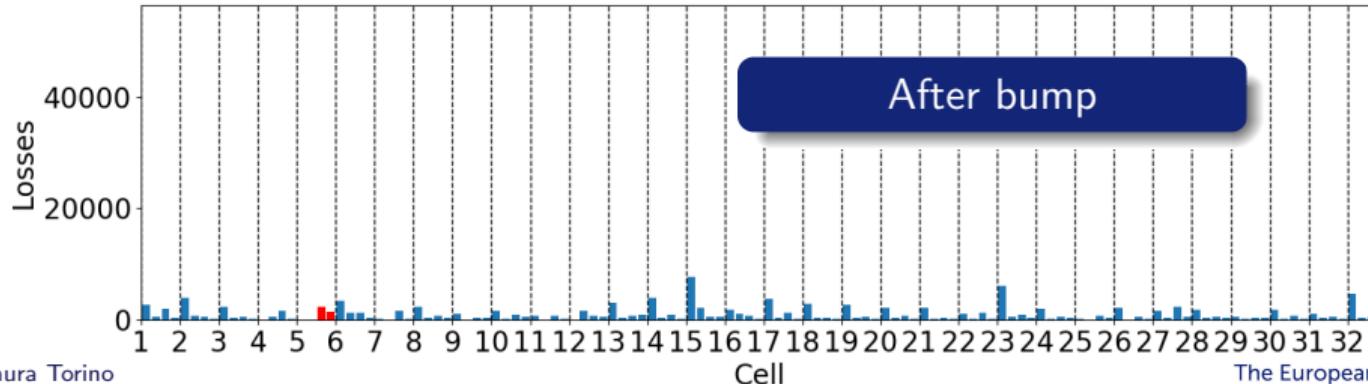

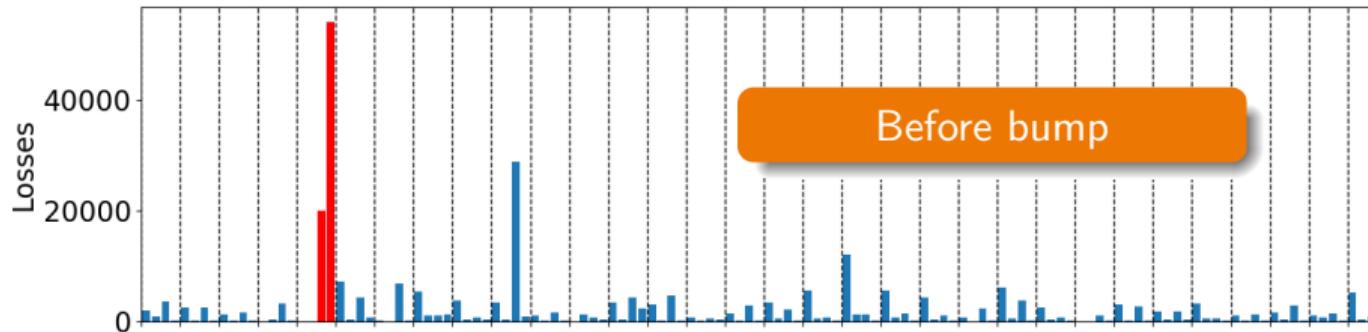

Obstacle 2: Chamber 10 Cell 8

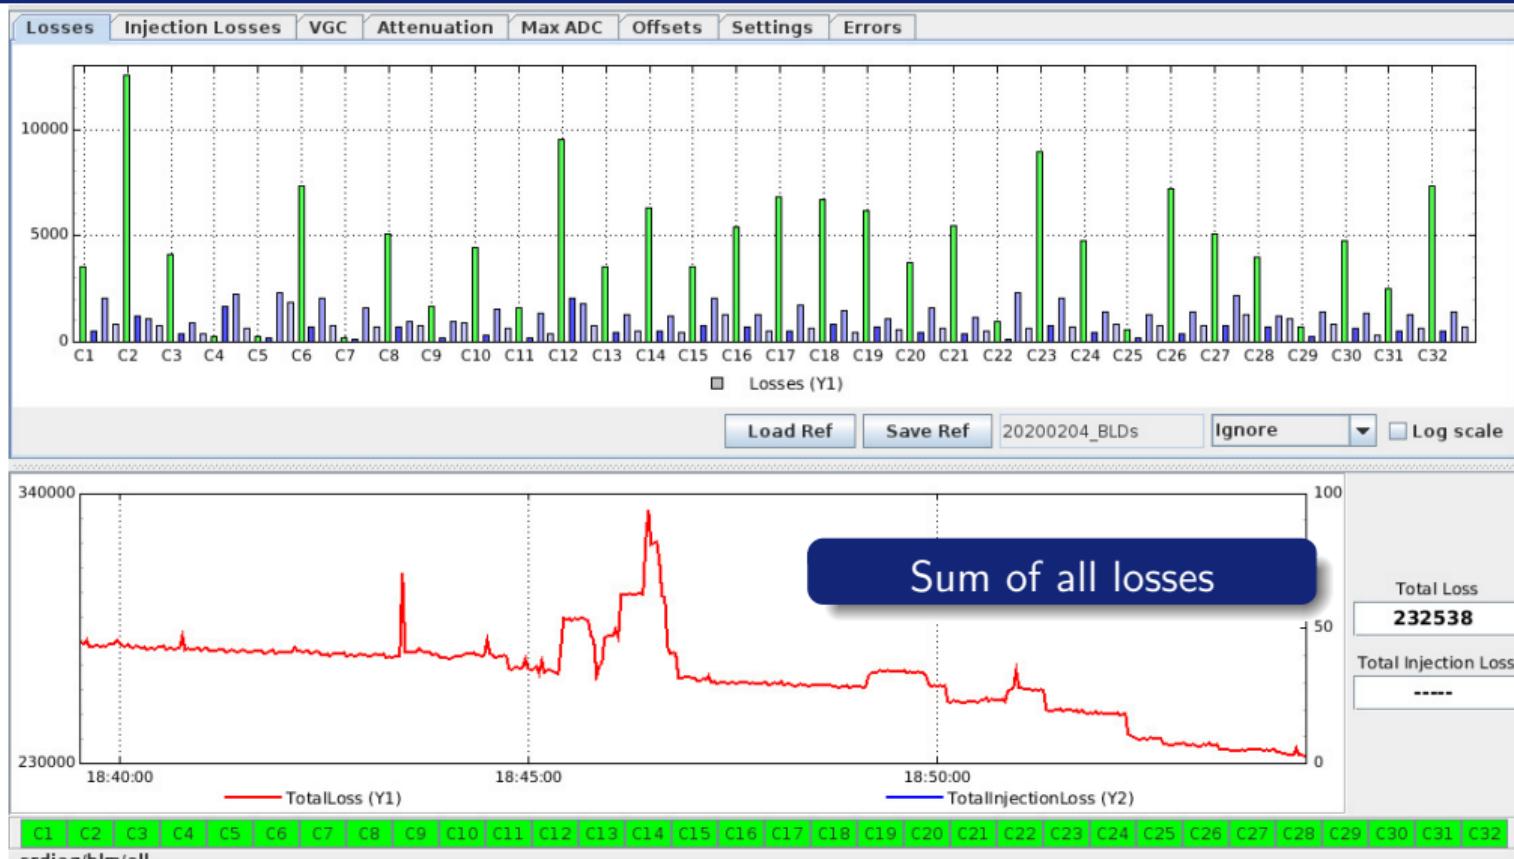

Obstacle 3: Chamber 7 Cell 5

Obstacle 3: Chamber 7 Cell 5 – SA data

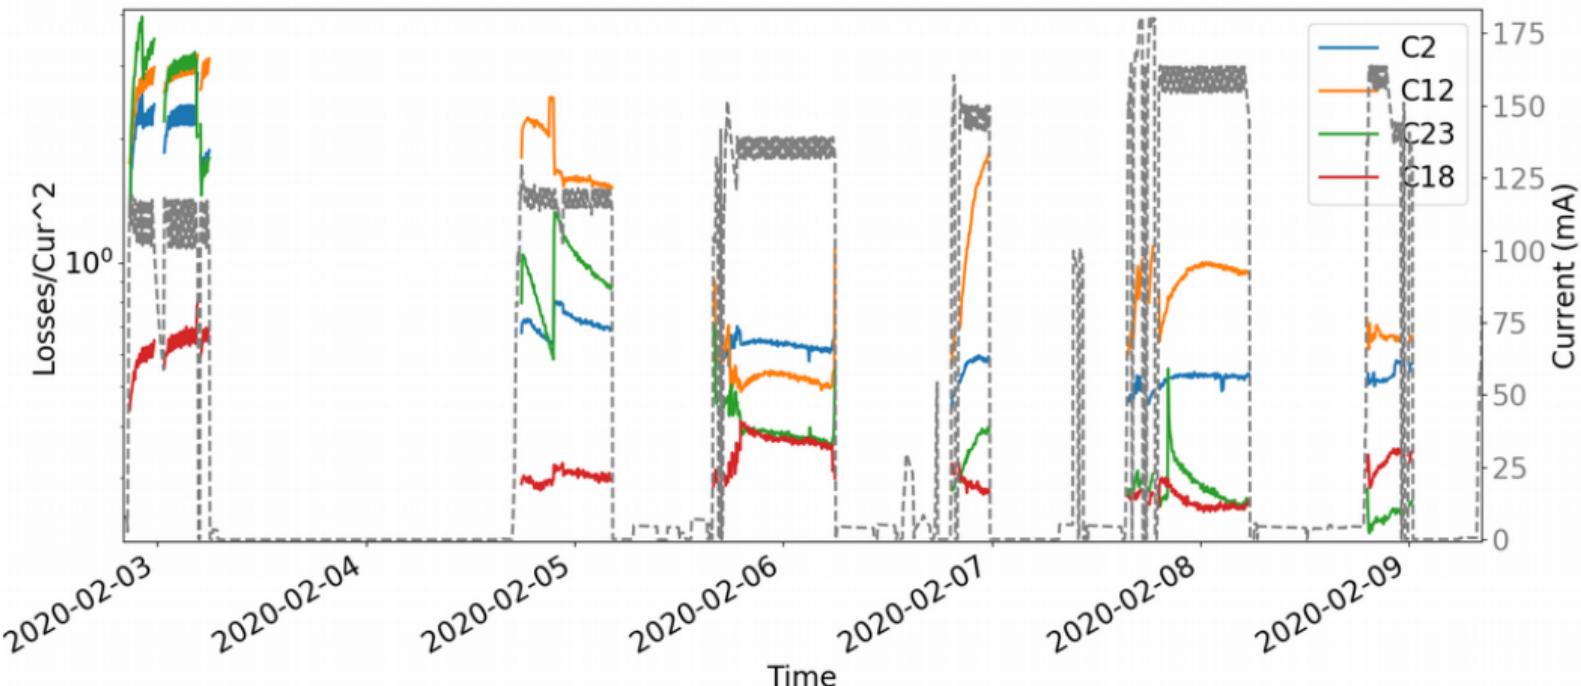

BLM – Machine Optimization – SA

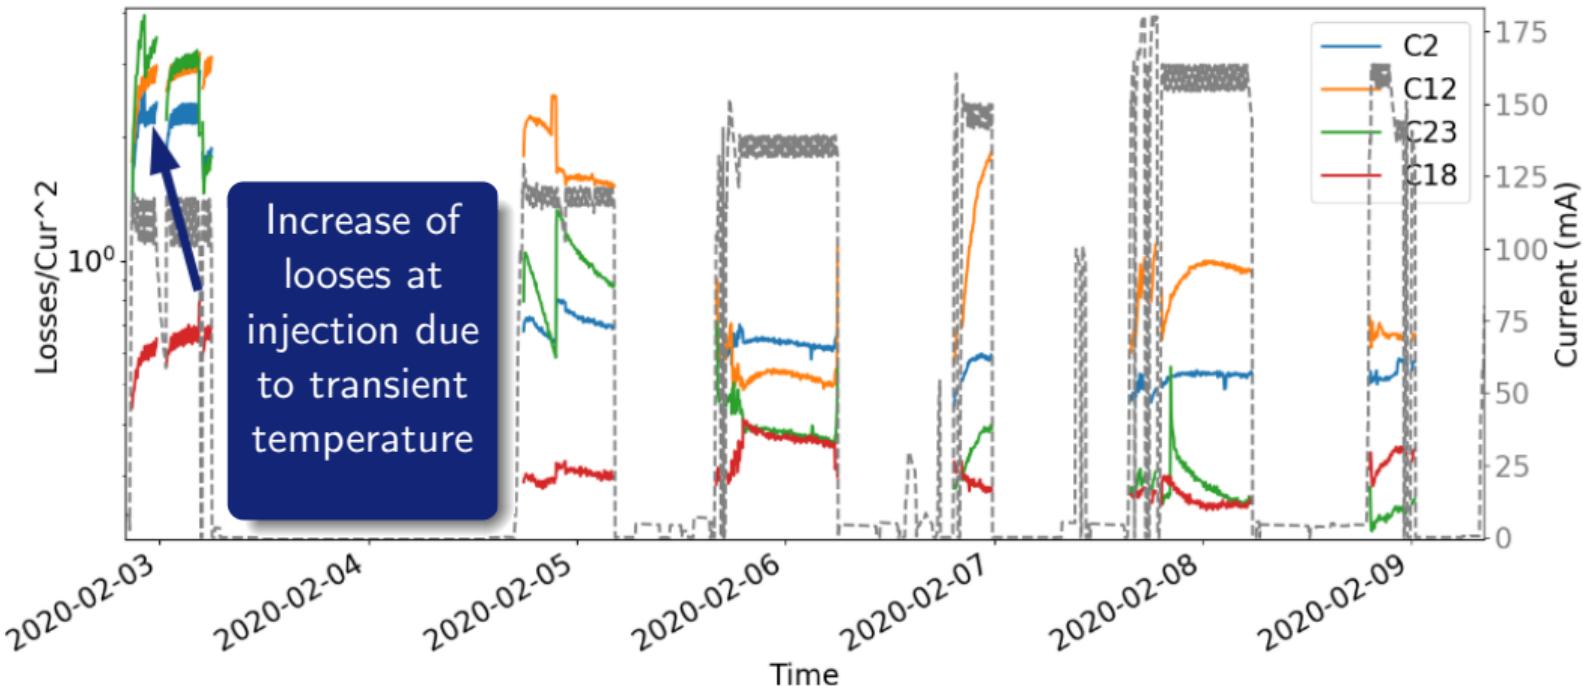

BLM – Machine Conditioning – SA

Check losses at straight section versus current to verify the conditioning
→ Losses/Current² stays constant at fixed temperature

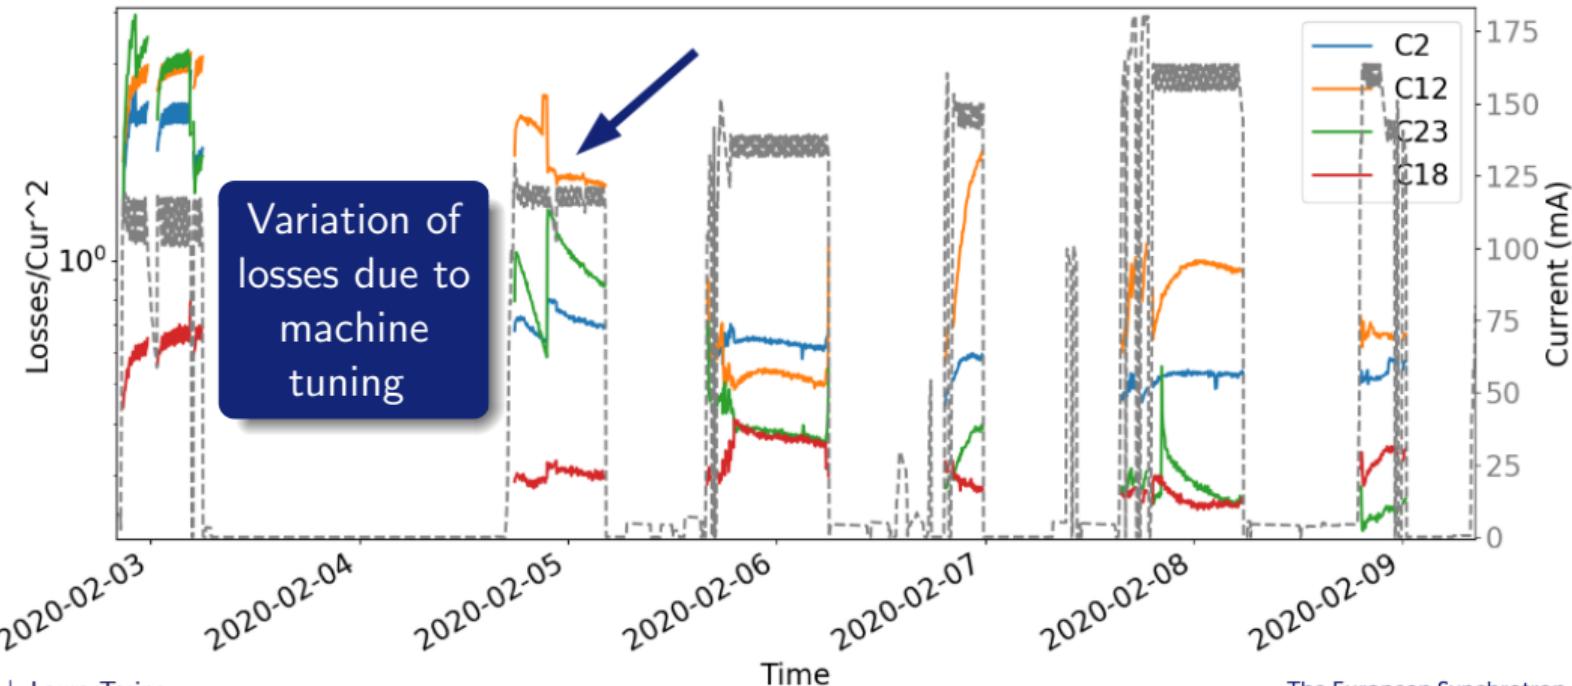

BLM – Machine Conditioning – SA

Check losses at straight section versus current to verify the conditioning
→ Losses/Current² stays constant at fixed temperature

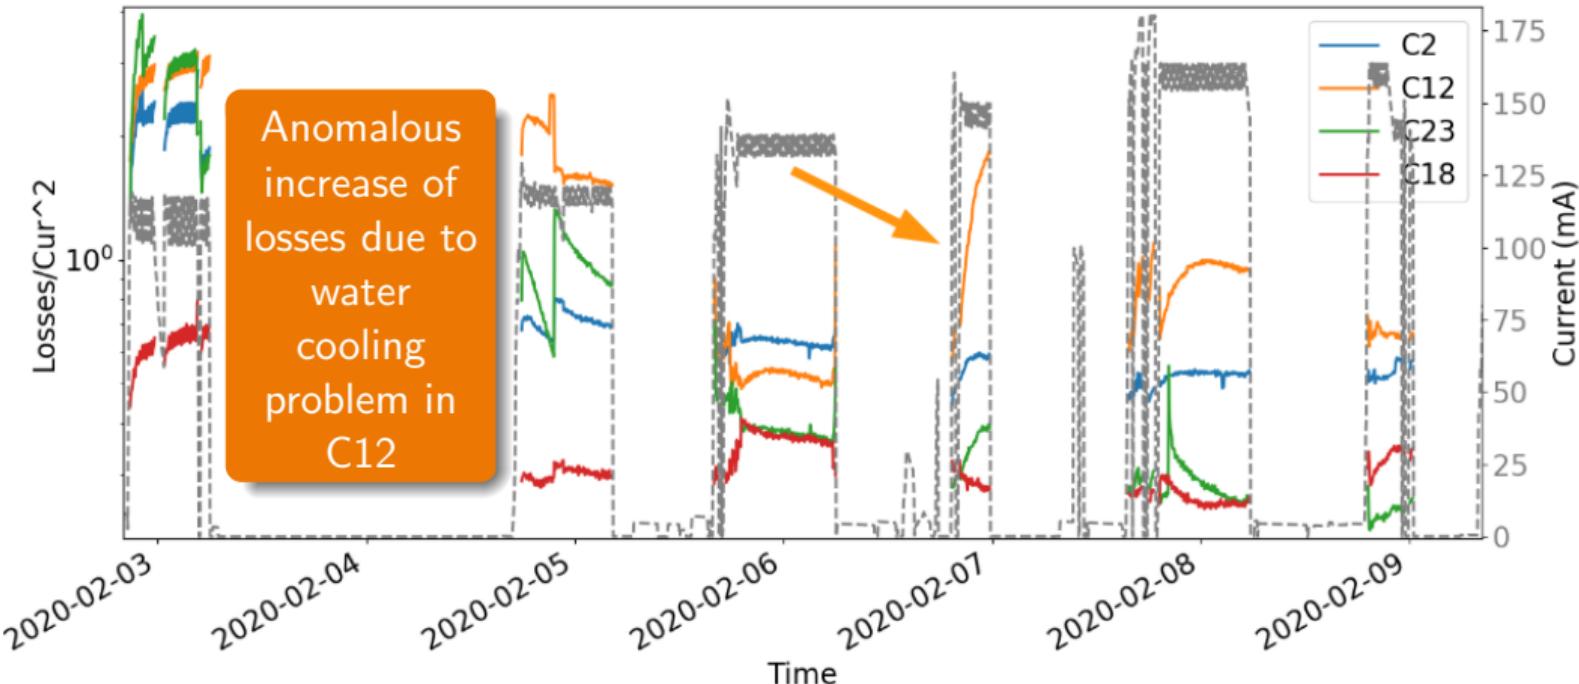

BLM – Machine Conditioning – SA

Check losses at straight section versus current to verify the conditioning
→ Losses/Current² stays constant at fixed temperature

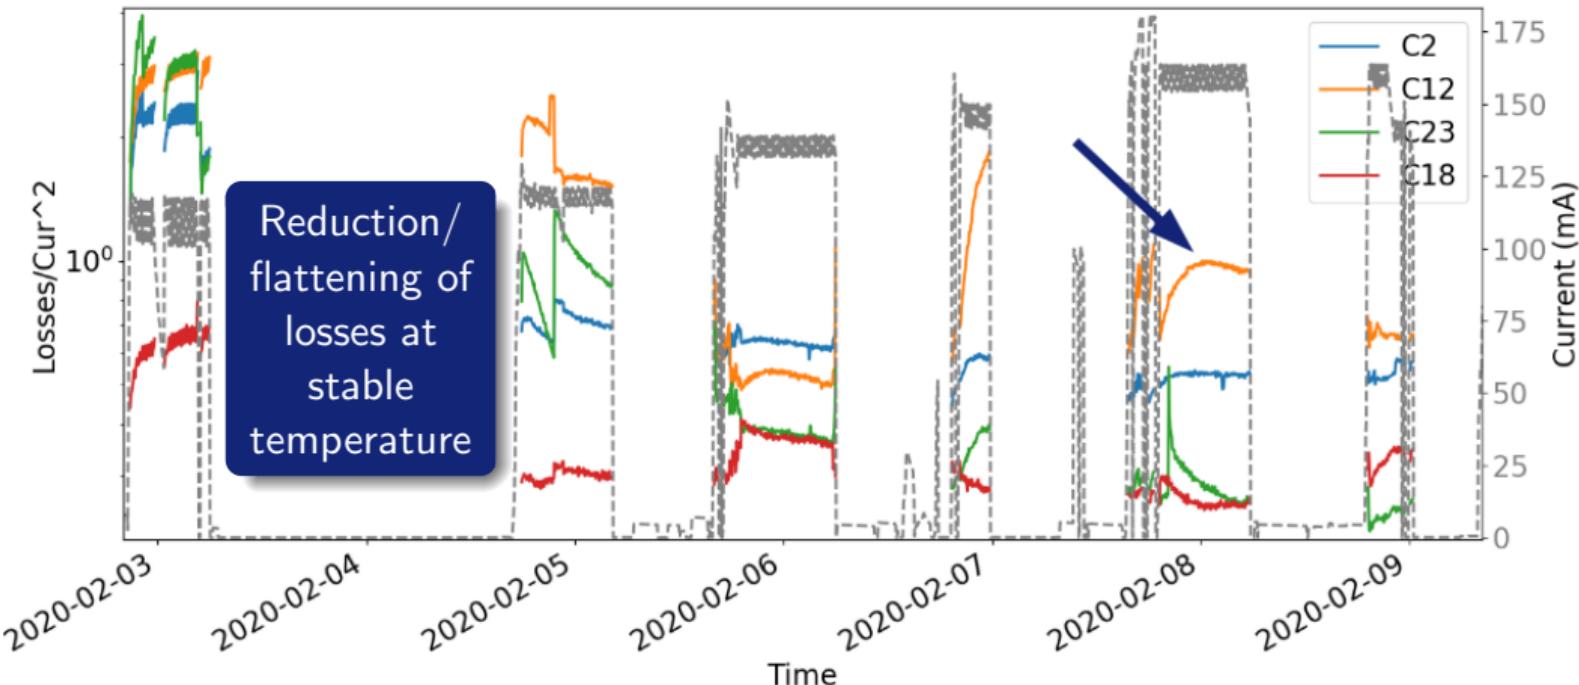

BLM – Machine Conditioning – SA

Check losses at straight section versus current to verify the conditioning
→ Losses/ Current^2 stays constant at fixed temperature

BLM – Machine Conditioning – SA

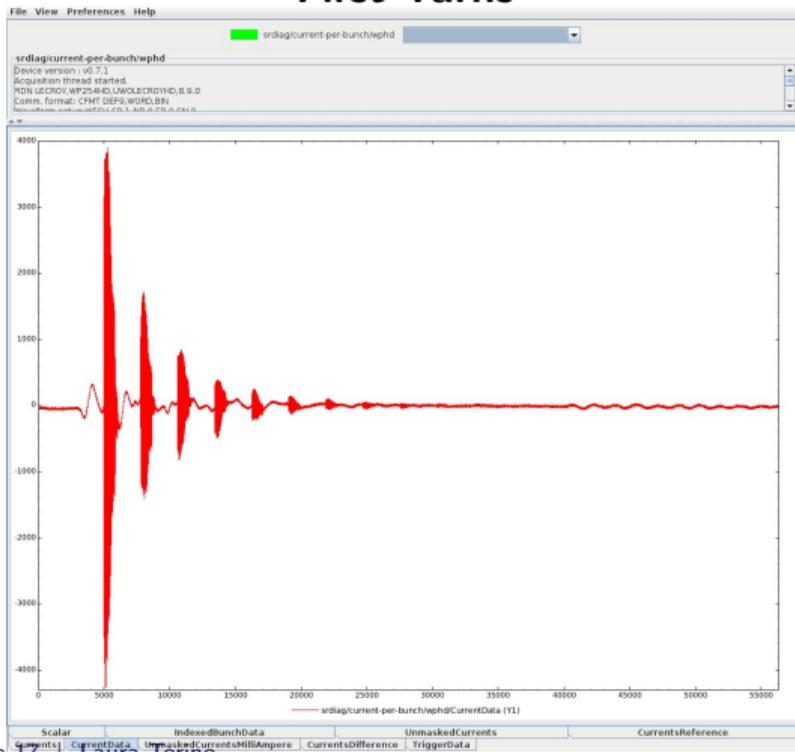

Check losses at straight section versus current to verify the conditioning
→ Losses/Current² stays constant at fixed temperature

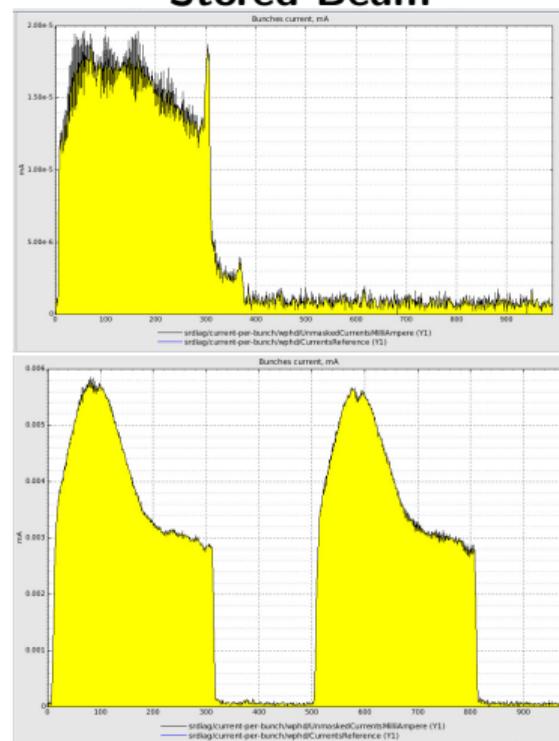

Fill Pattern Measurement

Stripline + Oscilloscope (12 bit dynamic range)

First Turns

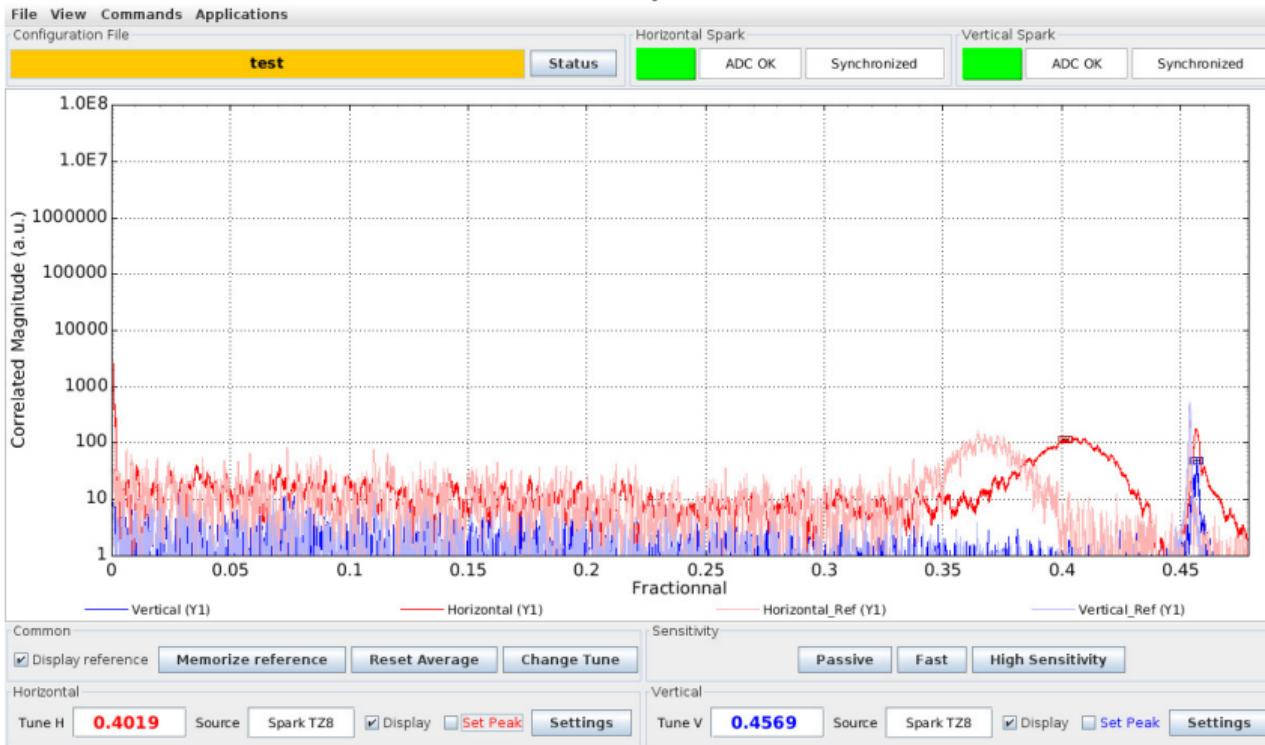

Stored Beam

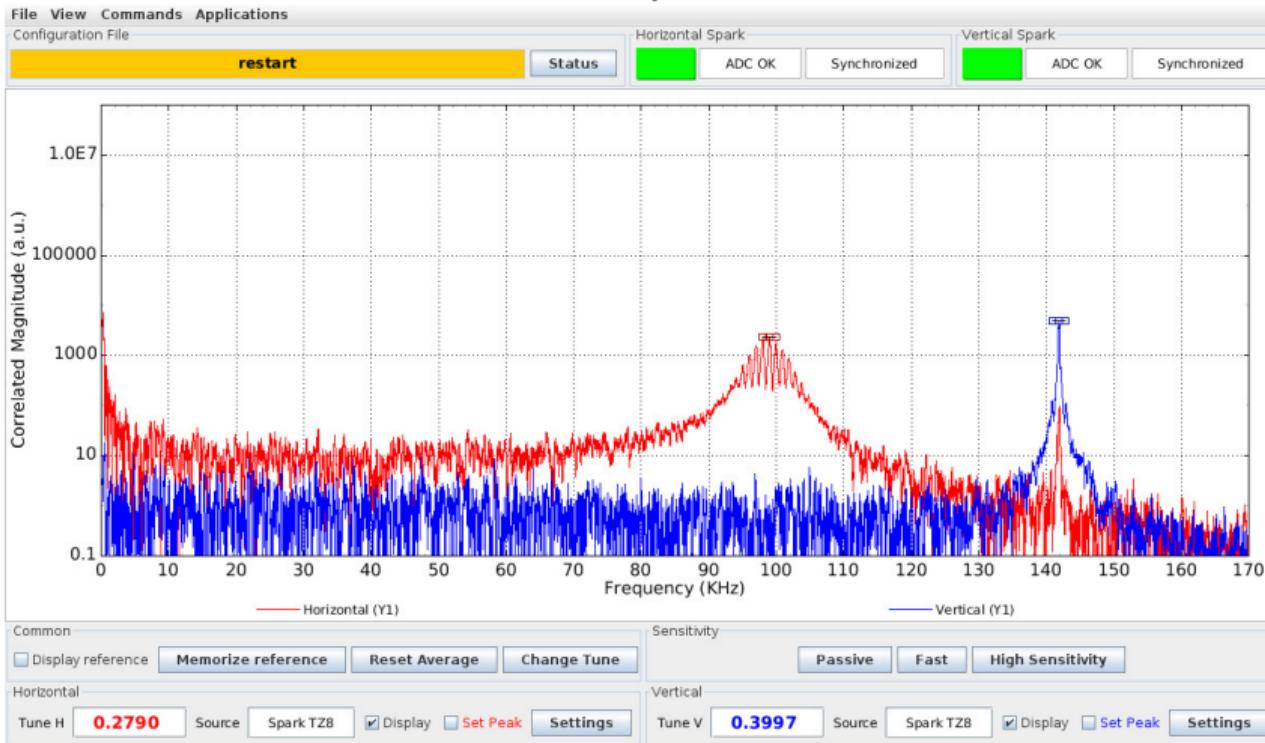

Tune Monitor

4 BPM buttons + Libera Spark + Shaker
16 μ A

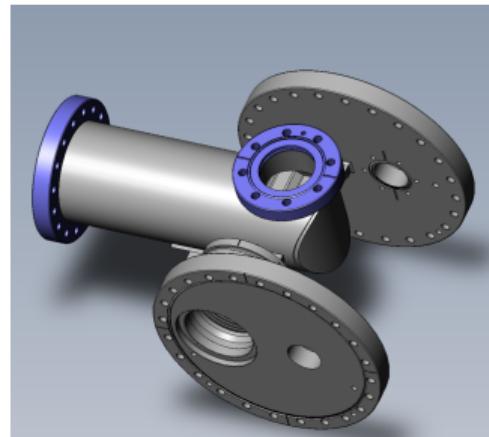

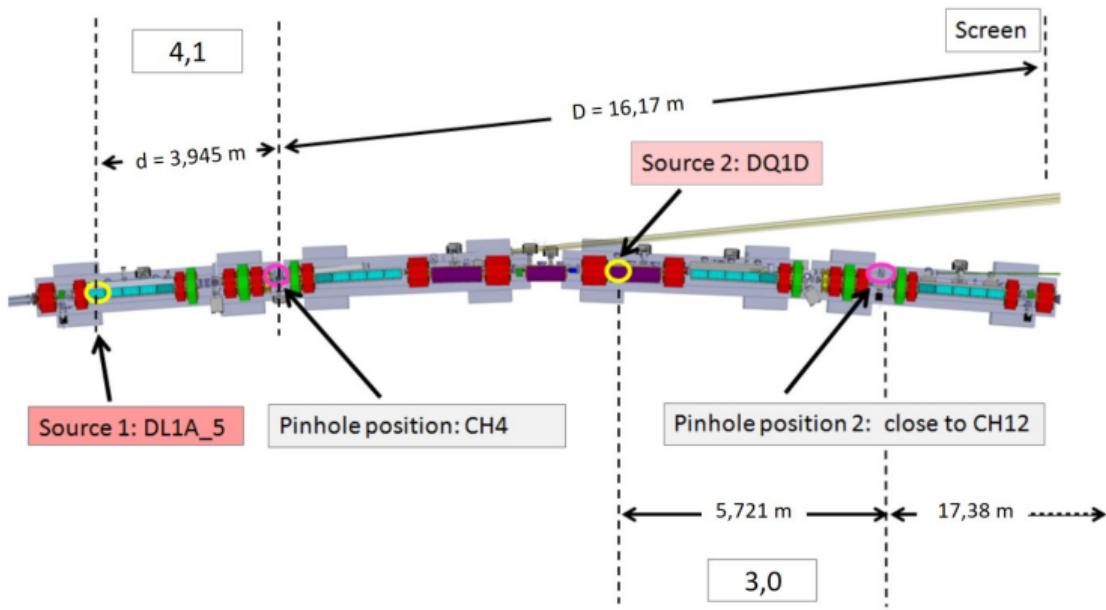

Tune Monitor

4 BPM buttons + Libera Spark + Shaker
50 μA

Emittance Monitor

5 x-rays ports available for **emittance** and **energy spread** measurements. Each of this port will be equipped with a **pinhole**.

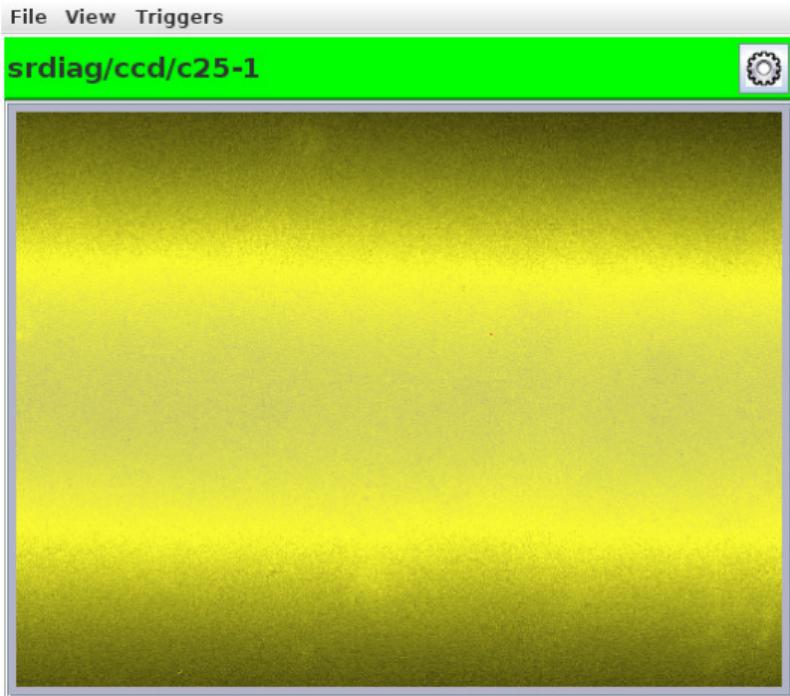

DL1A_5 vacuum chamber modified to locate the pinhole

Emittance – Stored Beam

First synchrotron light observed as soon as the beam was stored!

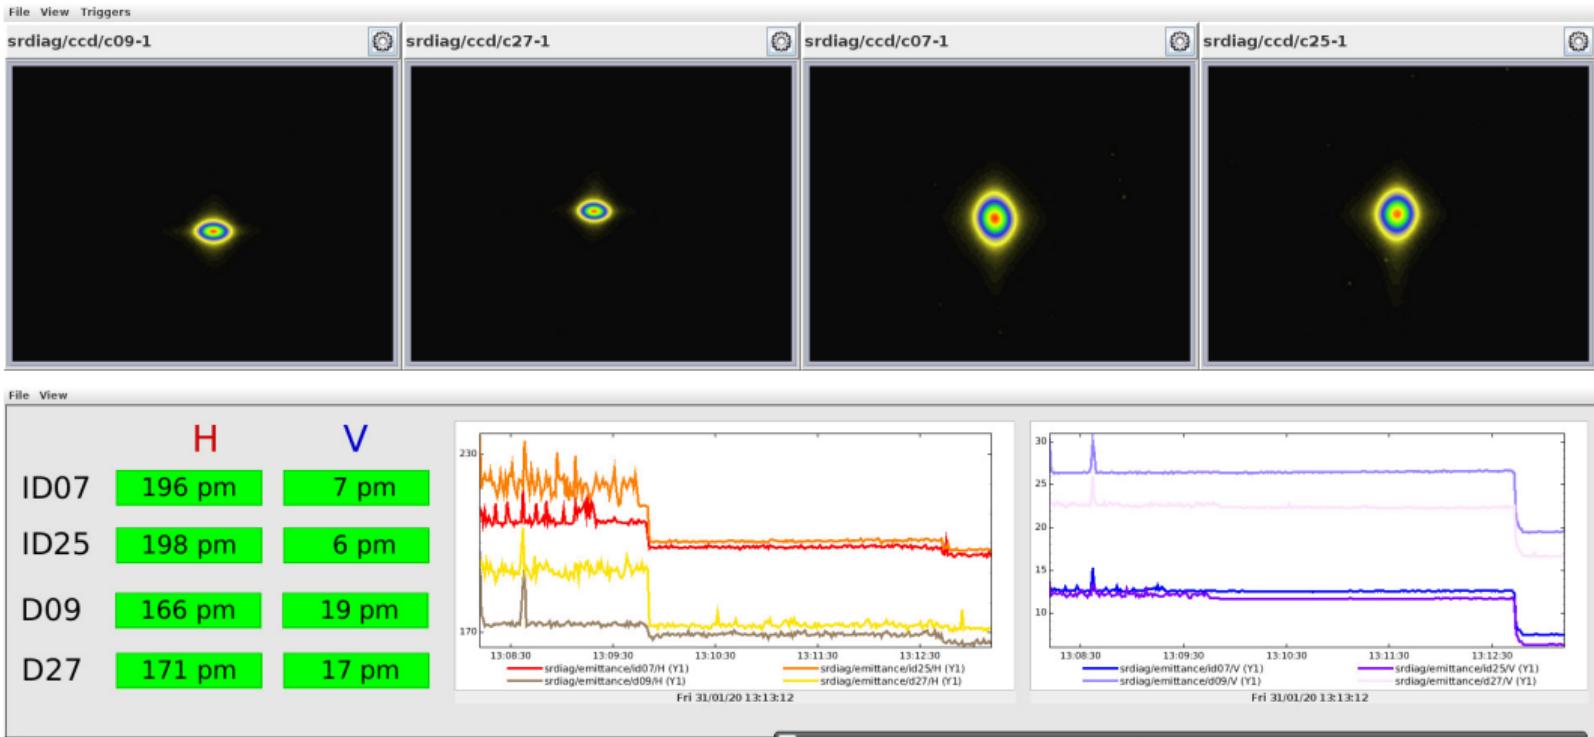

No Pinhole

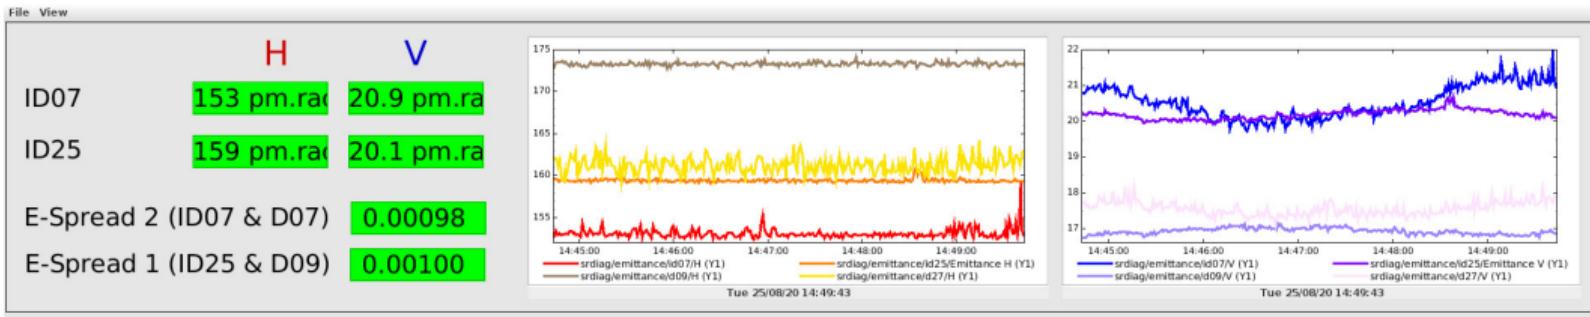

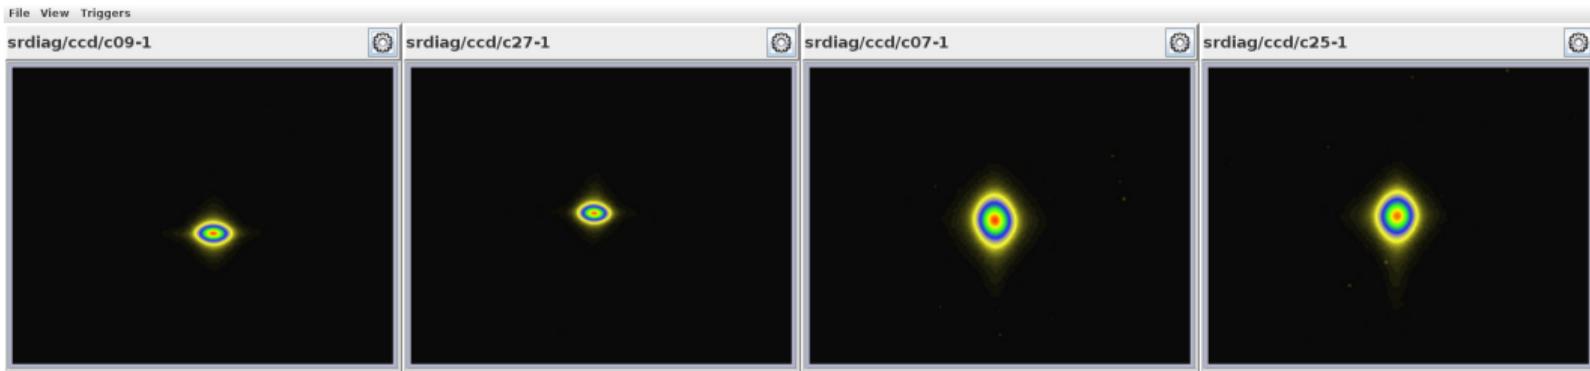

Pinhole

Emittance – Machine Optimization

Emittance – Machine Optimization

Part of the success of such a quick and efficient commissioning is related with the **reliability** of the beam instrumentation.

Most of the subsystems were already **installed and commissioned on the old machine** and were ready to be used since the first injection.

Overview
