

# HEAVY ION INJECTION CHAIN OF NICA COLLIDER

*Tuzikov A.  
JINR, Dubna, Russia*

## **Beam transfer from HILAC to Booster**

- **HILAC-Booster transport channel;**
- **Booster injection system.**

## **Beam transfer from Booster to Nuclotron**

- **Booster fast extraction system;**
- **Booster-Nuclotron transport channel;**
- **Nuclotron high energy beam injection system.**

## **Beam transfer from Nuclotron to Collider**

- **Nuclotron fast extraction system;**
- **Nuclotron-Collider transport channel;**
- **Collider injection system.**

# Beam transfer from HILAC to Booster

## Beam parameters

|                        |                   |
|------------------------|-------------------|
| Ions                   | Au <sup>31+</sup> |
| Energy, MeV/u          | 3.2               |
| Magnetic rigidity, T m | 1.6               |
| Electric rigidity, MV  | 40                |
| Ion number             | $2 \cdot 10^9$    |

## Goals

- Accumulation of required intensity of ions in Booster by means of several methods of beam injection.

**Commissioning: April 2019**

# HILAC-Booster beam transport channel

## Main goals

- The beam transport with minimal ion losses.
- The beam debunching.
- The beam matching.
- Separation and adsorption of neighbor charge states of ions.
- Providing different schemes of the beam injection into the Booster.

## Features

- Beam transport in the median plane of the Booster.
- The debuncher in non-dispersive region of the beam transport channel.

# HILAC-Booster beam transport channel

## Composition

# HILAC-Booster beam transport channel

## Beam dynamics

Beam envelopes

Separation

- Horizontal and vertical acceptances of the channel are equal to  $38 \pi \cdot \text{mm} \cdot \text{mrad}$ .
- Reducing  $\frac{\Delta p}{p}$  from  $5 \cdot 10^{-3}$  to  $1 \cdot 10^{-3}$  by means of the beam debunching.

# HILAC-Booster beam transport channel

## Parameters of main elements

### Dipoles

|                     |      |
|---------------------|------|
| Effective length, m | 0.65 |
| Max field, T        | 1    |
| Gap, mm             | 45   |

### Quadrupoles

|                     |             |
|---------------------|-------------|
| Effective length, m | 0.29 / 0.21 |
| Max gradient, T/m   | 10 / 19     |
| Gap (diameter), mm  | 95 / 71     |

### Steerers

|                     |           |
|---------------------|-----------|
| Effective length, m | 0.25      |
| Max field, T        | 0.05      |
| Gap, mm             | 125 × 110 |

# HILAC-Booster beam transport channel

## Parameters of main elements

### Debuncher

|                           |         |
|---------------------------|---------|
| Inner length, m           | 0.49    |
| Frequency, MHz            | 100.625 |
| Max effective voltage, kV | 260     |

Designed and  
fabricated by  
Bevatech team

## Status of channel equipment

- Power supplies are being assembled.
- Beam diagnostics is purchased partially. Full set of beam diagnostics will not be purchased until the channel commissioning.
- First part of vacuum equipment is delivered. Full set of vacuum equipment will be delivered in the nearest future.
- Design of stands is near completion.

# Beam transfer from Booster to Nuclotron

## Beam Parameters

|                                         |                   |
|-----------------------------------------|-------------------|
| Ions:                                   |                   |
| before stripping station                | Au <sup>31+</sup> |
| after stripping station                 | Au <sup>79+</sup> |
| Maximum magnetic rigidity of ions, T m: |                   |
| before stripping station                | 25                |
| after stripping station                 | 10                |
| Ion number                              | $1.5 \cdot 10^9$  |

## Goals

- Transfer of the beam with parameters which can be altered in wide ranges due to 1) use of different schemes of beam injection into Booster and 2) use of an electron cooling system.
- Ion stripping to a maximum charge state.

**Commissioning: December 2019**

# Booster-Nuclotron beam transport channel

## Goals

- The beam transport with minimal ion losses.
- Separation of neighbor charge states. Estimates of ion stripping at energy of 580 MeV/u: 100%  $\text{Au}^{31+} \rightarrow 80\% \text{Au}^{79+}$ ,  $\sim 20\% \text{Au}^{78+}$ . Due to high intensity of  $\text{Au}^{78+}$  ions they have to be extracted from the channel to an absorber.

## Parameters of magnetic elements

| Magnetic element | Type          | Effective length, m | Max. magnetic field (gradient), T (T/m) |
|------------------|---------------|---------------------|-----------------------------------------|
| BM1 - BM5        | sector dipole | 1.95                | 1.58                                    |
| SEPT_2           | septum        | 1.4                 | 1.3                                     |
| Q1 - Q4          | quadrupole    | 0.4                 | 14                                      |
| Q5 - Q8          | quadrupole    | 0.4                 | 20                                      |
| Corr1 - Corr3    | steerer       | 0.1                 | 0.15                                    |

Being designed by BINP team

# Beam transfer from Nuclotron to Collider

## Goals

- Accumulation of required intensity of ions (with help of barrier bucket system and beam cooling systems of Collider).

**Commissioning: December 2020**

## Beam Parameters

|                                |                   |
|--------------------------------|-------------------|
| Ions                           | Au <sup>79+</sup> |
| Energy of ions, GeV/u          | 1 ÷ 4.5           |
| Magnetic rigidity of ions, T m | 14 ÷ 45           |
| Ion number                     | 1·10 <sup>9</sup> |

# Nuclotron-Collider beam transport channel

## Goals

- The beam transport with minimal ion losses.
- The beam matching with lattice functions of the Collider rings (except vertical dispersion).

# Nuclotron-Collider beam transport channel

## Goals

- The beam transport with minimal ion losses.
- The beam matching with lattice functions of the Collider rings (except vertical dispersion).

# Nuclotron-Collider beam transport channel

## Layout

## Composition

# Nuclotron-Collider beam transport channel

## Beam dynamics (North Branch)

Horizontal and vertical acceptances of the north branch of the channel are equal to  $13$  and  $10 \pi \cdot \text{mm} \cdot \text{mrad}$  correspondingly.

# Nuclotron-Collider beam transport channel

## Beam dynamics (South Branch)

Horizontal and vertical acceptances of the south branch of the channel are equal to  $13$  and  $10 \pi \cdot \text{mm} \cdot \text{mrad}$  correspondingly.

# Nuclotron-Collider beam transport channel

## Parameters of pulsed magnet elements

| Magnetic element | Number | Effective length, m | Max. magnetic field (gradient), T (T/m) |
|------------------|--------|---------------------|-----------------------------------------|
| Long dipole      | 21     | 2                   | 1.5                                     |
| Short dipole     | 6      | 1.2                 | 1.5                                     |
| Quadrupole Q10   | 22     | 0.353               | 31                                      |
| Quadrupole Q15   | 6      | 0.519               | 31                                      |
| Steerer          | 33     | 0.466               | 0.114                                   |
